(9) Rationale The Philippines is an agricultural country wherein agri-fishery resources must be accounted for in response to food security and sustainability. Knowledge sharing and technology transfer are salient players in championing stability among farmers and fisherfolks while being empowered to have informed choices and decisions. There is a need to strengthen further the awareness and availment of the extension services from the Department of Agriculture. The modernization of the agriculture and fisheries extension in the country needs to have 1) a pluralistic system involving the public and private sector, NGOs, and other private players; 2) predominantly person-to-person to multiple delivery modes; and 3) use of digitally enabled tools (The World Bank, 2020). In the Philippines, there is a fragmented extension service delivery, compartmentalized implementation of banner programs, weak RDE-farmer/fisherfolk linkages, limited scaling of agri-fisher technologies, and low productivity and income of smallholders (Recoter, 2022). To strengthen the collaboration between DA, local government units, academe, and the private sector, the Provincial Agricultural and Fisheries Extension Systems (PAFES) will be institutionalized to bring extension services to the grassroots level amid the challenges of devolution. With PAFES, the province serves as an extension hub that synchronizes agricultural plans and programs and orchestrates the various stakeholders' activities. DA will co-plan, co-invest, co-implement, and co-monitor priority projects in the provinces, particularly as they embark on commodity specializations to maximize comparative advantage. A Joint Memorandum Circular will be issued to formalize the institutionalization of the PAFES at the national level (DA, 2021). Baseline data will be needed to ensure the effectiveness of the PAFES implementation. Laying the groundwork for opportunities leading to effective planning, implementation, monitoring and evaluation, and re-planning is essential. With this, a rapid appraisal will be done to assess the resources of the LGUs and their capacity to provide agriculture and fisheries extension services.	
(9-A) Project Description This DA-funded study will appraise the capabilities of the Agriculture and Fisheries Extension Services of the Province of Capiz. The core research team of Capiz State University will be formed to conduct this study as per the memorandum of agreement between the Department of Agriculture Regional Field Office 6 and Capiz State University. The Social Science and Industrial Technology Research and Development Center of the Research, Development, and Extension Office of the University will spearhead this study. The CAPSU core research team on PAFES will identify specific details on logistics, including personnel capability building, coordination with the target respondents and agencies, fieldwork, monitoring, evaluation, and reports preparation, among others.

(10) Statement of the Problem

This study will appraise the Agriculture and Fisheries Extension Services in the Province of Capiz.

Study 1 - Resources and Capabilities in Agriculture and Fisheries Extension Services of the Province of Capiz

This study will determine the resources and capabilities of the Agriculture and Fisheries Extension Services of the Province of Capiz.

Specifically, this study will seek answers to these questions:

1. What is the demographic profile of the respondents when grouped according to:
 - a. OFWs, b. AFC, and c. LGU?
2. What is the socio-economic status of the LGU in terms of:
 - a. Resources, and b. Agri-Fishery programs and projects?
3. What are the LGUs' prospects for the agri-fishery sector in terms of:
 - a. plans, b. budget, and c. direct investment?
4. What are the local issues and challenges in the delivery of extension services?
5. What are the potential opportunities for inputs for program enhancement?

Study 2 – Farm Mechanization and Operations Among Agriculture and Fisheries Councils in the Province of Capiz

This study will determine the farm mechanization and operations among Agriculture and Fisheries Councils in the Province of Capiz.

Specifically, this study will seek answers to these questions:

1. What are the farm operations and practices of the farmers?
2. What are the farmers' attitudes toward farm mechanization?
3. What is the status of the machine and equipment ownership of the farmers?
4. What are the sources of power and labor in farm operations?
5. What farm machinery/implements are used in harvesting and post-harvest operations of the farmers?
6. What is the farmers' preference for the ownership of machinery?
7. What are the reasons for wanting to own ownership of the farmers?

Study 3 – Agricultural Production Programs and Services of the LGU: Awareness, Availment, Satisfaction, and Need for Action

This study will determine the agricultural production programs and services of the local government units in the Province of Capiz.

Specifically, this study will seek to answer these questions:

1. What programs are the respondents aware of?
2. What programs have the respondents availed of?
3. What programs are the respondents satisfied with?
4. What programs need appropriate action?

(11) Review of Literature

The mechanism of developing an information network system of agricultural development through cyber extension must be developed by extension workers to fulfill farmer requirements for agriculture information. The involvement of extension workers in agricultural information network systems through cyber extension is characterized by different ages, extension workers' income, and the use of cyber extension between extension workers, which is civil servants and extension workers, which is still honored. Factors related to the involvement of extension workers in information systems of agricultural development through cyber extension are age, extension worker's income, motivation, level of cosmopolitan, and extension workers' performance (Gultom & Gitosaputro, 2018).

The agricultural extension workers in SAMARIA Area, Occidental Mindoro, have an average age of 48.76 years, long extension experience of 18.14 years, and earned a college degree related to

	RESEARCH PROPOSAL	Page	Page 4 of 7

agriculture. They "always" introduce new technologies and practices on organic agriculture with the farmers through individual farm/ home visits, farmers' group meetings, and the use of Information and Communication Technologies (ICT)). The agriculture extension delivery system in SAMARIA Area, Occidental Mindoro, needs help in implementing organic agriculture initiatives at the municipal level. Furthermore, agriculture extension workers' age is significantly related to the technology transfer modalities utilized in organic agriculture (Declaro-Ruedas, 2019).

Information is a valuable commodity. The more experience development agencies gain in project implementation, the more we become aware of the vast amount of information needed to carry out projects well. These information needs include 1) Information about the communities where the project will intervene, the social structures of those communities and the families who live there, their social safety nets, etc.; 2) Information about livelihoods, economic structures, and how people ensure their basic human needs; 3) Information about beliefs and cultural identities that affect people's decisions and choices; 4) Information about physical environments, resources, and the places in which people conduct their activities; and 4) many other things depending on the nature of the project or intervention. While at one point information may have been seen as a "documentary" aspect of projects there is now widespread agreement that information gathering is a necessary prerequisite to carrying out successful project activities, and must continue throughout the time that a project is in place and perhaps even beyond (Freudenberger, 2015).

Some references to the results of research in the field of entrepreneurship to encourage a better entrepreneurial spirit are increasing entrepreneurial knowledge in a sustainable manner (Katsikis & Kyrgidou, 2007), increasing entrepreneurial skills (Valenzuela et al., 2020) both conceptual, strategy, and the courage to take entrepreneurial risks (Belas et al., 2014). However, in Macko & Tyszka's (2009) research, novice entrepreneurs are afraid to take entrepreneurial risks. If these three can be done and the economic conditions are supportive, it will create business growth and a brand of entrepreneurial goodwill (Kozlinska et al., 2020).

The limited administrative and political decentralization and centralistic human resources management restrict downward accountability to the community. The social rules also constrain the downward accountability that local politicians and administrators observe. For downward accountability to materialize, formal public administration systems need to introduce incentives to that effect (Lameck & Hulst, 2021).

(12) Theoretical Framework

Theory of Planned Behavior Change. The Theory of Planned Behavior (TPB) started as the Theory of Reasoned Action in 1980 to predict an individual's intention to engage in a behavior at a specific time and place. The theory was intended to explain all behaviors over which people can exert self-control. The critical component of this model is behavioral intent; behavioral intentions are influenced by the attitude about the likelihood that the behavior will have the expected outcome and the subjective evaluation of the risks and benefits of that outcome (LaMorte, 2019).

Technology Acceptance Model. This has been one of the most influential models of technology acceptance, with two primary factors influencing an individual's intention to use new technology: perceived ease of use and perceived usefulness (Davis & Marangunic, 2020).

Empowerment Theory. This involves using intervention methods to guide people toward achieving a sense of control. Community empowerment works by increasing the community's influence over the structures and policies that affect the lived experiences of the community and its members. Community empowerment works by increasing the community's influence over the structures and policies that affect the lived experiences of the community and its members. Influence increases often occur through partnerships between those in power and other community members (Balcazar, Keys, & Vryhof, 2019).

(13) Methodology

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 30, 2019
			Page	Page 5 of 7

Research Design

The study will use the descriptive research design. The descriptive method of research is used to obtain information concerning the current status of the phenomena under study and to describe what exists concerning variables or conditions covered in the study. This type of research quantifies and generalizes results from a significant population of interest. It also measures the incidence of various views and opinions of the sample (Reganit, 2010).

Respondents of the Study

The study participants will be those directly involved in PAFES, including agricultural extension workers, the agriculture fisheries council, and all the LGUs in the two congressional districts of Capiz Province. Identified respondents will be taken in a complete enumeration.

Research Instrument

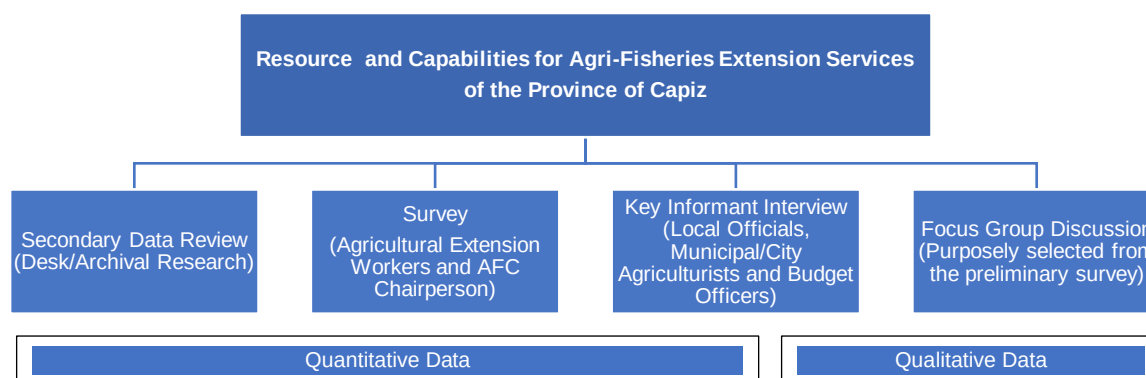

The researcher-modified questionnaire on Rapid Appraisal of the Capabilities in Agriculture and Fisheries Extension Services of the Province of Capiz will be used. This research instrument will be based on the existing PAFES instrument of other state universities and colleges with modifications appropriate for the current study context.

Locale and Time of the Study

This study will cover the 16 municipalities and one (1) component city in the province of Capiz from December 2022 to April 2023.

Data Gathering Procedure

Data will be gathered following a work plan intended for the project implementation on PAFES. Secondary data review or desk research, survey, key informant interviews, and focus group discussions will be conducted. These procedures will ensure the comprehensive gathering of data, providing substantial inputs to reports.

Data Analysis

A brief description or summary demographic profile of the respondents will be constructed when they are classified according to the type of participants (whether AEWs, AFCs, or LGU) using frequency counts, percentages, and arithmetic mean. These will also be utilized in determining the resources and capabilities in agriculture and fisheries extension services of the Province of Capiz, farm mechanization and operations among agriculture and fisheries councils in the Province of Capiz, and agricultural production programs and services of the LGU in terms of awareness, availment, satisfaction, and need for action.

Qualitative data will be analyzed thematically, with corresponding frequency counts, percentages, and ranks, to understand better the data presented.

(14) Major Activities/Work plan

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
