(9) Rationale (State the research problem and significance of the project to the current needs of the country. The proposal should justify resource expenditure. A typical justification would include a brief introduction, a general statement concerning the historical basis for R & D and, thrusts being addressed, utilization of the expected output and the impact information generated will have on science, the target users and the country.)

The current coronavirus disease 2019 (COVID-19) pandemic caused by severe acute respiratory syndrome coronavirus is an unprecedented situation that represents the biggest public health challenge of the 21st century. Due to a strong correlation between the host immune status and COVID-19 prognosis, immunocompromised patients were added within higher risk group for severe illness from COVID-19. About 71% of those requiring hospitalization for COVID-19 exclusive of those in intensive care had at least one underlying health issue. A patient may be immunocompromised due to underlying health issue such as chronic diseases, medical treatments, organ transplant, age, and smoking.

Chronic health conditions are the major cause of illness, disability, and death despite the fact that much is known about how to prevent chronic disease and delay or avoid many related complications. A systematic a comprehensive approach to caring for patients with chronic disease using a registry has been shown to improve the quality of chronic care delivery. A disease registry refers to an organized system that collects, analyses, and disseminates the data and information on a group of people defined by a particular disease, condition, exposure, or health-related service. Computerized registries generally require a database to store integrated patient information and a software application that can sort the information into different views and reports.

Registries designed for patients with sharing characteristics (e.g. diagnosis, implanted device, therapy, or risk of developing a disease) have for decades served as an important source of the data needed to assess clinical performance, provide health technology assessment, or assess policy implications on a local, regional, national and in some cases international level. If successfully implemented, a patient registry would a powerful tool for observing the course of disease; understanding variations in treatment and outcomes; examining factors that influence prognosis and quality of life; describing health care patterns including appropriateness of care and disparities in the delivery of health care; assessing care effectiveness; monitoring safety and harm; and measuring quality of care. In public health, data registry contributes to population surveillance, assessment of disease burden in the general population, health care planning and identifying areas in health care services policies that require intervention. In line with this, the researchers would propose the initiation of a computerized system for the profiling and disease registry of immuno compromised residents in the Municipality of Pontevedra, Capiz.

(9-A) Project Description (Discuss the project strategy and plan of action of the project. It should also describe the technical procedures and other works needed to carry out the project objectives. The relationship of the project inputs and activities should be explained clearly in this section. Projects similar/related to the proposed project should be mentioned.)

The study will be conducted at Capiz State University, Bailan, Pontevedra, Capiz. This study will use the Barangay Records of the selected barangays in the Municipality of Pontevedra, Capiz. This study will include all of the immunocompromised residents' records in the different selected barangays in the municipality of Pontevedra such as their personal profile and the diseases that they possess.

The system will be limited only or to be used only by the barangay officials in the selected barangays in the Municipality of Pontevedra, Capiz. The system will be composed of two types of accounts to barangay captain's account and the barangay secretary's account. The barangay captain's account serves as the administrator of the system. This can manage and modify the system. Barangay

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- PROP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 25, 2019
			Page	Page 3 of 23

secretary's account is created by the barangay captain's account and has several functions such as viewing and searching for immunocompromised residents' data and records in order to generate and print reports used for transactions and other legal purposes.

(10) Objectives/Statement of the Problem (for Social Sciences) (Statement of the specific purpose to address the problem areas of the project.)

1 The study will generally aim to program a computerized system for the profiling and disease registry of immuno compromised residents in the Municipality of Pontevedra, Capiz. Specifically, the study will focus on:

- Generating a digital database of the immunosuppressed residents and their personal profile, health condition, and disease using existing barangay records.
- Establishing limitations on user access to stored data, functions, and features of the computerized system based on authorization defined by the barangay. Specifically, the study ought to design and develop the following system features:
 - a) security features to protect data from any unauthorized access.
 - b) creating accounts and updating the records of the immunocompromised residents' residing in the different selected barangays of the Pontevedra, Capiz.
 - c) query feature for searching individual records of the immunocompromised residents.
 - d) database for storing individual records of the immunocompromised residents.
 - e) feature for generating individual records of the immunocompromised residents as well as reports for the transactions and other legal purposes.
- Training of authorized personnel with regards to the functions, features and troubleshooting of the computerized system.

(11) Scientific Basis/Theoretical Framework (Include concepts, theories and variables that indicate relevant relationships to be tested.)

The proposed system will be using the Input-Process-Output Theory. The input phase includes knowledge (system and the technical skills), hardware and software requirements and developing tools. The process phase will include system security, registration, records and report generation. Lastly, in the output phase, is the developed system.

(12) Review of Literature/Prior Art Search (Related researchers/activities that have been conducted. State-of-the-art of current technology / information from which the project proposal will take-off).

The literature and studies cited in this chapter contains the different concept, understanding, and ideas, generalization or conclusions and different development related to the study of the Profiling and Disease Registry of Immunocompromised Residents of Pontevedra, Capiz from the past up to the present and which serves as the researcher's guide in developing the project. Those that were also include in this chapter helps in familiarizing information that are relevant and similar to the present study.

Conceptual Literature

Barangay Profiling

The need to address societal issues of every community is a salient aspect that demands

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- PROP-01
			Revision No.	00
	Document Title:	RESEARCH PROPOSAL	Effective Date	November 25, 2019
			Page	Page 4 of 23

attention from the people in authority. These are important responsibilities of every barangay and its official in the Philippines. Profiling each household in the community using information and communication technology could achieve good governance through E-government as its core. Once profile data is aggregated, essential information could provide statistics in labor and employment, family income and expenditures, demography by (population) and (age), water and sanitation, type of housing and education (Lacasandile, et al., 2020).

Disease Registries

Disease registries have become an essential tool for relevant health care stakeholders to deliver improved quality patient outcomes. Unfortunately to date, there are relatively few established national disease registries (Evans et al., **2011**, Rubinstein et al., **2010**). This situation is exacerbated for rare diseases as there are over 7,000 identified and reported, and no single institution, and in many cases no single country, has sufficient numbers of patients to undertake generalisable clinical and translational research. The geographic spread of patients is a major impediment to recruitment into clinical trials and most rare diseases do not have a specific International Classification of Diseases code, which hampers research that uses existing sources of information (Rubinstein et al., **2010**, Schieppati A et al., 2008).

Rare disease registries (RDRs) are an essential tool to improve knowledge and monitor interventions for rare diseases. If designed appropriately, patient and disease related information captured within them can become the cornerstone for effective diagnosis and new therapies. Surprisingly however, registries possess a diverse range of functionality, operate in different, often-times incompatible, software environments and serve various, and sometimes incongruous, purposes. Given the ambitious goals of the International Rare Diseases Research Consortium (IRDiRC) by 2020 and beyond, RDRs must be designed with the agility to evolve and efficiently interoperate in an ever changing rare disease landscape, as well as to cater for rapid changes in Information Communication Technologies. In this paper, we contend that RDR requirements will also evolve in response to a number of factors such as changing disease definitions and diagnostic criteria, the requirement to integrate patient/disease information from advances in either biotechnology and/or phenotyping approaches, as well as the need to adapt dynamically to security and privacy concerns. We dispel a number of myths in RDR development, outline key criteria for robust and sustainable RDR implementation and introduce the concept of a RDR Checklist to guide future RDR development. (Bellgard et al., 2013).

The databases proved to be an extremely valuable resource for our students when completing their research for National History Day, offering a number of reliable sources that students could then narrow down [and] ensuring that my students were utilizing academic sources, and I felt confident requiring my students to utilize primary sources since they could easily plug this criteria into the filter and find a number of confirmed primary source documents. All of this helps to prepare them for the type of research they will be asked to do in college. (Shaw, 2019).

Immunocompromised

The past two decades have witnessed an increase in the number of patients who are immunocompromised as a consequence of a primary or secondary immunodeficiency disorder or from the use of agents that depress one or more components of the immune system. Broadly defined, an immunocompromised host has an alteration in phagocytic, cellular, or humoral immunity that increases the risk of an infectious complication or an opportunistic process such as a lymphoproliferative disorder

or cancer (Pizzo, 1999).

Related Studies

Integrated Chronic Non-Communicable Disease Registry System (ICNCDRS)

The Department of Health (DOH) has exerted determined effort to assess the existing disease registries in attempts to provide policy makers and program managers with essential data. The project on the Assessment of Existing Chronic Non-Communicable Disease Registry Systems did just this. The result of that effort together with the outcome of the Design for Potential Linkage and Accessibility by the DOH for Effective Policy Directions determined that the appropriate platform and network can facilitate the design of an integrated system solution that can establish and operate the linkages that can produce meaningful information.

To rally the concomitant appeal generated by such effort, the DOH further presented a proof-of-principle prototype or model to showcase the design of an information management network that will benefit health managers, policy makers and workers. The prototype demonstrated that their existing resources can be maximized so that data and information can be sourced, generated, disseminated and used optimally.

The Integrated Chronic Non-Communicable Disease Registry System software was based on the previous integrated design concept and model thus presented. Policy makers and program managers will have access and linkage to these registry systems, and the DOH can generate the consolidated reports that can guide them in prioritizing health resource investments and program interventions.

Community Health Information Tracking System (CHITS)

With the volume of health information typically collected in a government health center, it has always been a challenge for the health personnel to consolidate data into a cohesive and relevant report. Patient's information and other health-related data are collected manually using paper-based methods which are often prone to error, destruction, and alteration. Some medication errors happen due to poor handwriting, ambiguous abbreviations, and disorganized keeping of records.

Reporting health data through paper records also consumes more time which causes significant delays and reporting of inaccurate information. This may prevent decision makers from fully understanding the health status of their communities. As a result, there is also a gap in developing well-planned strategies that will combat the country's health problems and reduce inequity in healthcare access.

The Solution

The Community Health Information Tracking System (CHITS), one of the six Philhealth-certified electronic medical record (EMR) systems being used in Regional Health Unit (RHU) level, reduces patient's waiting time and improves monitoring of patient care through efficient data encoding and records retrieval. The technology aims to contribute to effective and efficient delivery of health services

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- PROP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 25, 2019
			Page	Page 6 of 23

through appropriate information and communication strategy, and to aid in health decision-making at the local level. By utilizing CHITS, a patient's records can be searched only a few seconds upon admission, while laboratory requests, results and reports can be generated automatically.

To support the efforts in digitizing health records, the entire system is designed to follow the workflow of primary healthcare facilities including the paper-based documentation process. This setup will make the process easier for health workers or users to learn and adopt the system with minimal supervision needed.

CHITS is one of the two EMRs that can seamlessly connect and interoperate with the RxBox, the PCHRD-supported biomedical device capable of measuring a patient's temperature, blood pressure, heart rate, oxygen saturation, uterine contractions, and electrocardiogram readings. It is also proven to be interoperable using an international health IT standard called Health Level 7-Fast Healthcare Interoperability Resources (HL7 FHIR) which is used for data exchange among various healthcare providers. Interoperability with HL7 FHIR ensures that reports generated through CHITS will remain consistent with other systems, even those from other healthcare organizations. Currently, CHITS creates a separate module for the collection, processing, and analysis of clinical and epidemiological data of patients with rare diseases, such as X-linked Dystonia Parkinsonism or XDP. Equipped with this module, CHITS can generate detailed analysis of data for patients with XDP. The EMR module for XDP Care will be piloted in a healthcare facility in Capiz, this year. As CHITS is capable of immediate and direct transmission of electronic reports to the Department of Health (DOH) and the Philippine Health Insurance Corporation (PhilHealth), reimbursements can be processed faster.

Technology Development Stage

CHITS already obtained copyright protection. UP Manila also applied for a trademark, which is currently under review. Through the project, selected UP faculty researchers and staff formed an SEC-registered startup company, the Pivotal Peak Digital Health Solutions, Inc. A licensing agreement is currently being finalized with UP Manila.

To date, CHITS is being used in 35 Rural Health Units (RHUs) nationwide, 33 public health centers in Taguig City, 12 in Pasay City, and 91 in Quezon City.

The project team is currently seeking initial capital infusion from angel investors to cover more health facilities. Investments from venture capitalists would allow them to expand their portfolio, while training partners, technical support and deployment would allow them to expand their market reach.

(13) Methodology (Details such as; a) variables to be measured and evaluated; b) treatments to be used and their layout; c) experimental procedures and design; d) statistical analysis; e) evaluation method and observations to be made, strategies for implementation.)

This study will be using the Software Development Phases which are discussed below:

1. Planning. A sprint planning meeting will be conducted on the onset of software development. During this meeting, all of the projects requisites and scopes will be discussed and prioritized. High-level requirements will be finalized based on end user perspectives. The product backlog is will be created, analyzed and completed during this meeting.
2. Analysis. The system analysis is a process of collecting and interpreting facts, identifying the problems, and decomposition of a system into its components. Problem solving techniques will be

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- PROP-01

			Effective Date	November 25, 2019
			Page	Page 7 of 23

discussed that could improve the system and ensure that all the components of the system work efficiently to accomplish their purpose.

3. System Design. The design phase comes from after a good understanding of user requirements; in this phase, the elements of the system, the components, modules, architecture and the different interfaces and type of data that goes through the system will be descused.
4. Flowchart. The system flowchart will be designed to symbolically show how the data flow throughout the system.
5. Coding/Algorithm. This system will be using Simple Recursive Algorithms and Simple Binary Search.
6. Testing Phase. Testing will be performed by the real users, and by the team of specialized personnel. It is systematic and automated to ensure that the actual outcomes are compared and equal to the predicted and desired outcomes.

Assessment on the Product Quality(Functional Suitability, Performance Efficiency, Compatibility, Usability, Reliability, Security, Maintainability, Freedom from risk and Context Coverage)

Rating	Verbal Interpretation
5- Very Much Agree	(the acceptance level 90 to 100%)
4. Agree	(the acceptance level is 70 -89%)
3-Moderately Agree	(the acceptance level is just right, 50-69%)
2-Slightly Agree	(the acceptance level is, 30 -49%)
1-Disagree	(the acceptance level is 0-29%)

(14) Major Activities/Work plan (Enumerate in chronological order the task to be undertaken. Use gantt chart. Below is an example. This can be modified base on your desired Work plan.)

TASK NAME	AY 2021-

(15) Expected Output (Indicate the specific products, processes or services which the project is expected to produce; quantify when possible)

Installer burn in DVD with case, Operational manual and system software

(15) Technology Transfer Activity Design (Indicate the specific products, activity design, processes or services to be transferred as extension activities)

The researchers will be conducting a training for the target clientele for them to understand and be acquainted with the usage and features of the software. Through this, they can make use of the availability of the software in their desktop in its full capacity.

To assure and validate the sustainability of the project, the researchers will be monitoring the offices who are using the system.

(16) Targets Beneficiaries (Who the clientele are and what are the expected outcome/effects of the use of the projects output)

Local Government Unit. This will help the Municipality of Pontevedra in the province of Capiz to have a barangay health record of all the persons having an immuno compromise diseases.

Barangay. This will benefit barangay official from the system. Through this, the barangay can have resident data profiling and disease registry of their constituents.

University. The Barangay Profiling and Disease Registry System can provide accurate and detailed information of data, whenever these are needed and required by the administration.

Faculty. This will serve as reference for the faculty members to know the activities that will be held in this school.

Staff. This will serve as reference for the staff to know the activities that will be held in the school.

Students. This will serve as reference for the students to know the schedule of activities they are required to attend.
