(9) Rationale (State the research problem and significance of the project to the current needs of the country. The proposal should justify resource expenditure. A typical justification would include a brief introduction, a general statement concerning the historical basis for R & D and, thrusts being addressed, utilization of the expected output and the impact information generated will have on science, the target users and the country.)

This study wanted to determine the influence of online learning to the interpersonal communication skills of Engineering and architecture students of Capiz State University

With the advent of pandemic all over the world, many institutions shut down. People were confined in their homes as everyone is afraid to get infected with the virus. Schools, government and private offices were closed and businesses stopped their operations. For a while everything stopped. No busy bustling streets and people coming back and forth.

Government and private agencies devised work-from-home schemes to continue with their operations. Almost all transactions became online. Many colleges and universities have offered online courses as a viable alternative to traditional face-to-face instruction. However, considerable concerns and problems have developed, particularly as it relates to the influence of online learning to the interpersonal communication skills of students due to limitations brought about by Covid19 Pandemic and virtual or online learning, much exposure to social media and gadgets.

The COVID-19 pandemic brought great disruption to all aspects of life specifically on how classes were conducted both in an offline and online modes. The sudden shift to purely online method of teaching and learning was a result of the lockdowns that were imposed by the Philippine government. While some institutions have dealt with the situation by shutting down operations, others continued to deliver instructions and lessons using the Internet and different applications that support online learning. The continuation of classes online had caused several issues from students and teachers ranging from lack of technology to mental health matters (Ignacio, 2021).

According to Almahasees (2021) online learning as a flexible and useful learning source during the crisis and some limitations and is a relaxed and productive source of knowledge. It also helps students 24 hour to have access to learning materials asynchronously at any time in a day.

Knowing the influence of online learning to the interpersonal communication would help the learning institution understand social networking and how it can influence students' interpersonal and communication skills. If the effects of online learning to the interpersonal communication skills of the students can be identified, then faculty can create teaching strategies and techniques that are appropriate or can address in teaching lessons that would enhance the communication skills of the students.

Students in the new learning environment are much exposed to different online platforms. Most of those belonging to the older generation would often remark that using gadgets will lead to lesser personal contacts and eventually will result to a decline in the interpersonal skills of the younger generation.

(9-A) Project Description (Discuss the project strategy and plan of action of the project. It should also describe the technical procedures and other works needed to carry out the project objectives. The relationship of the project inputs and activities should be explained clearly in this section. Projects similar/related to the proposed project should be mentioned. .)

(10) Objectives/Statement of the Problem (for Social Sciences) (Statement of the specific purpose to address the problem areas of the project.)

The main focus of this study is to determine the influence of online learning on the interpersonal communication skills of the students.

Specifically, the study sought answers to the following questions:

1. What is level of interpersonal skills of students as an entire group and when they are grouped according to gender, age, course, year, location and mode of connectivity?
2. What is level of interpersonal skills of students as an entire group and when they are grouped according to gender, age, course, location and mode of connectivity?
3. Are there significant differences in the extent of online learning of students when they are grouped according to gender, age, course, year location and mode of connectivity?
4. Are there significant differences in the level of interpersonal skills of students when they are grouped according gender, age, course, year location and mode of connectivity
5. Are there significant differences in the level of interpersonal skills of students when they are grouped according to gender, age, course, year location and mode of connectivity
6. Are there significant relationships among the extent of online learning and interpersonal communication skills of students?

(11) Review of Literature/Prior Art Search (Related researchers/activities that have been conducted. State-of –the-art of current technology / information from which the project proposal will take-off).

Online Learning In a Global perspective

According to UNESCO, nearly 75% of the world's student population has been affected by school closures due to the COVID-19 pandemic. This is a first in history and it will have a lasting impact on students, parents and education systems — both global and local. The COVID-19 pandemic is a new phenomenon that is truly worldwide in its impact. In the past, we have had only epidemics afflicting certain regions of the world, but this time the virus has spread to all corners of the globe (Soon, 2020).

Many studies have been conducted on online education since the pandemic. Aristovnik (2020) discussed in a comprehensive large scale research on how students perceive the impacts of the first wave of COVID-19 crisis in early 2020 on various aspects of their lives on a global level. With a sample of 30,383 students from 62 countries, the study reveals that amid the worldwide lockdown and transition to online learning, students were most satisfied with the support provided by teaching staff and their universities' public relations. Still, deficient computer skills and the perception of a higher workload prevented them from perceiving their own improved performance in the new teaching environment. Further, the result states that students were mainly concerned about issues to do with their future professional career and studies, and experienced boredom, anxiety, and frustration. The pandemic has led to the adoption of particular hygienic behaviours (e.g., wearing masks, washing hands) and discouraged certain daily practices (e.g., leaving home, shaking hands). Students were also more satisfied with the role played by hospitals and universities during the epidemic compared to the governments and banks. The findings also show that students with certain socio-demographic characteristics (male, part-time, first-level, applied sciences, a lower living standard, from Africa or Asia) were significantly less satisfied with their academic work/life during the crisis, whereas female, full-time, first-level students and students faced with financial problems were generally affected more by the

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 30, 2019
			Page	Page 4 of 16

pandemic in terms of their emotional life and personal circumstances. Key factors influencing students' satisfaction with the role of their university are also identified.

Moreover, it revealed that lack of computer skills and the perception of a relatively higher workload prevented students from perceiving a higher performance while adapting to the 'new normal'; namely, education from a distance. During the lockdown, students primarily raised concerns about their future professional career and study issues and were mainly bored, anxious, and frustrated.

Likewise, study of Selvanathan, et. al., (2020) on students learning experiences during COVID-19 revealed that Malaysian University students showed high dissatisfaction with their performances during COVID-19. There had reported that the students preferred to take the courses in traditional delivery mode rather than online. Most of the students were dissatisfied with the implementation of virtual learning mode during this pandemic (Aiman, 2020). Besides, proper technology is a requirement to improve the internet access, so the students freely access the internet for their classes as well as for gaining their study materials. Some universities provided a limited e-library services for downloadable resources.

Also, the students showed high disagreement with the accessibility and availability of the instructor. The lecturers faced difficulty in teaching virtually due to their insufficient preparation in adopting the new method for teaching. Due to this limitation, the students in urban areas gained benefits of the technology compared to who lived at rural areas. Limited internet access is challenging to the students in rural areas for their studies, which also resulted in delay for the task submission. According to Yeoh (2020), most students in rural schools don't own phones and faced difficulty in e-learning during MCO. So, this result showed that Malaysia as a whole are not ready for implementing any new type of working system virtually. The limitation would have been solved to date if Malaysia started practicing this new norms since other developed countries started practicing working virtual today rather than due to the pandemic has been alerted us.

Consequently, it was found that in countries with significant internet infrastructure in place, such as the Republic of Korea, have important advantages when it comes to online education. However, even there, concerns have been raised whether students and teachers have adequate skills to engage successfully with software and learning technologies.

These concerns are magnified in countries with less infrastructure. In Indonesia, for example, students have given mixed reviews for the recent forced transition to online courses. Some of them find it difficult to stay focused, believe that online lectures are less effective, and struggle to interact online with lecturers and peers. This is not only because of internet access issues, but also because students (and staff) are not used to such environments or do not have the skills to make optimal use of such platforms. In a survey of 1,045 students conducted by the Indonesia University of Education, 48% of students appeared to need more time to get used to internet-based learning, despite the availability of teaching applications.

In the face of these challenges, countries using multiple avenues to ensure a continuation of learning; collaborations between institutions and between the private sector and institutions are expanding; and the initial uncertainty of international students seem to be moving towards a willingness to engage in different forms of international education. We are also seeing institutions getting their campuses and procedures ready for a "new normal" to welcome staff and students back (Noah Yarrow, 2020).

Online Learning in Philippine Setting

The findings revealed from the study of Barrot, et. al., (2021) that the online learning challenges of

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 30, 2019
			Page	Page 5 of 16

students varied in terms of type and extent. Their greatest challenge was linked to their learning environment at home, while their least challenge was technological literacy and competency. Based on the students' responses, their challenges were also found to be aggravated by the pandemic, especially in terms of quality of learning experience, mental health, finances, interaction, and mobility.

It was shown that the learning environment is the greatest challenge that students needed to hurdle, particularly distractions at home (e.g., noise) and limitations in learning space and facilities. This data suggests that online learning challenges during the pandemic somehow vary from the typical challenges that students experience in a pre-pandemic online learning environment. One possible explanation for this result is that restriction in mobility may have aggravated this challenge since they could not go to the school or other learning spaces beyond the vicinity of their respective houses. As shown in the data, the imposition of lockdown restricted students' learning experience (e.g., internship and laboratory experiments), limited their interaction with peers and teachers, caused depression, stress, and anxiety among students, and depleted the financial resources of those who belong to lower-income group. All of these adversely impacted students' learning experience.

Regarding the impact of COVID-19 on students' online learning experience, the findings reveal that teaching and learning quality and students' mental health were the most affected. The anxiety that students experienced does not only come from the threats of COVID-19 itself but also from social and physical restrictions, unfamiliarity with new learning platforms, technical issues, and concerns about financial resources (Barrot, et. al., 2021).

Another study conducted by Dayagmil et. Al., (2021) explored the challenges and issues in teaching and learning continuity of public higher education in the Philippines in plight of COVID-19 pandemic. The authors found that that during school lockdowns, the teachers made adjustments in teaching and learning designs guided by the policies implemented by the institution. Further, it was discussed that most of the students had difficulty complying with the learning activities and requirements due to limited or no internet connectivity.

Accordingly, Giray, et. Al., (2022) explored on the online learning experiences of Filipino college students enrolled in the academic year 2021-2022 during the CoVid-19 pandemic. The results showed that although many Filipino college students find online learning amid the COVID-19 pandemic to be a positive experience such as it provides various conveniences, eliminates the necessity of public transportation amid the COVID-19 pandemic, among others, a more significant number of respondents believe otherwise. The majority of the respondents shared a general difficulty adjusting toward the new online learning setup because of problems related to technology and Internet connectivity, mental health, finances, and time and space management. A large portion of students also got their motivation to continue studying despite the pandemic from fear of being left behind, parental persuasion, and aspiration to help the family.

Furthermore, Rotas and Cahapay (2020) revealed in a study the following categories of difficulties in remote learning: unstable internet connectivity; inadequate learning resources; electric power interruptions; vague learning contents; overloaded lesson activities; limited teacher scaffolds; poor peer communication; conflict with home responsibilities; poor learning environment; financial related problems; physical health compromises; and mental health struggles.

In addition, results on the study of Baticulon, et. al., (2021) also stated that among barriers to online learning in times of Covid-19, the most frequently encountered by most of the students were difficulty adjusting learning styles, having to perform responsibilities at home, and poor communication or lack of clear directions from educators. Approximately two-thirds of the respondents always or often confronted these barriers. Lack of physical space conducive for studying and mental health difficulties were also common. The data also showed that the availability of fast and reliable internet connection was a bigger concern than either device ownership or technical aptitude. One out of ten students always or often lacked basic needs such as food, water, medicine, and security.

Moreover, there were additional challenges mentioned by the respondents. (1) technological, which pertain to hardware, software, and internet connectivity; (2) individual, which involve students' learning styles, physical, and mental health; (3) domestic, which are concerns at home or within the family, including financial distress; (4) institutional, which revolve around administration, medical curriculum, school resources, and educator skills; and (5) community barriers, which include lockdown restrictions, infrastructure challenges, and sociopolitical issues.

On the same note, the themes that were revealed in the study conducted by Alvarez (2021) presented the

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 30, 2019
			Page	Page 6 of 16

learning journey of selected NSTP 2 students in navigating their remote civic welfare training service course. It was stated that students are experiencing different levels of adjustments just to learn the process of adapting to the current context of emergency remote teaching and learning. Interestingly, the findings from this study showed that some of the participants have learned to develop their sense of learning autonomously. The transactional distance that exists between the teacher and students created a gap; thus, it was substituted by highly learning content materials to ensure to have meaningful learning experiences. This made the participants more decisive in understanding the learning concepts as they learned to process the learning materials at their own pace. Throughout the pacing of the asynchronous modality of learning, it paved the way to expose the learners to stand on their own and define their learning, hence, allowing them to hone their self-responsibility over the learning materials. Furthermore, in a time of uncertainties, a ray of hope has been seen. Even if the course was delivered in a full asynchronous modality, it was interesting to understand that the participants have learned to digest and process reflectively the essential learning concepts. In this way, the development of reflective learning engagement serves as a mobilizer for students to rethink the learning contents which helped to reflect on the things they have observed and experienced. This also shows that learning asynchronously is not a hindrance for students to learning to become reflective thinkers. It also makes sense that regardless of the modality, the need to ensure proper facilitation of learning is necessary to guide the students to the path of learning they wanted to be.

In the same way, Custodio (2021) found in his the study of that students faced plenty of challenges in their online learning experience despite the benefits of social media usage for online. This according to the author may be due to the sudden and forced implementation of online learning across all schools in the Philippines when the COVID-19 pandemic started. He further explained that students and teachers alike are unprepared for the sudden shift of mode of learning, and some of them do not have the means to access the needed resources for it. This was evident in the reports of the respondents of the study regarding internet connectivity problems. Despite these difficulties, the respondents felt that they had no choice but to accept the current situation and adapt to it. Such attitudes may have stemmed from their judgment that while social media usage for online learning is not the most effective way for them to learn, it is currently the only alternative available to them.

Interpersonal

Interpersonal skills are the life skills we use every day to communicate and interact with other people, both individually and in groups. People who have worked on developing strong interpersonal skills are usually more successful in both their professional and personal lives. Interpersonal Skills become so natural that we may take them for granted, never thinking about how we communicate with other people. With a little time and effort you can develop these skills. Good interpersonal skills can improve many aspects of your life - professionally and socially - they lead to better understanding and better relationships. It is sometimes referred to as: social skills, people skills, soft skills, communication skills or life skills. Although these terms can include interpersonal skills they tend to be broader and therefore may also refer other types of skills (<http://www.skillsyouneed.com/interpersonal-skills.html>, retrieved: November 2021).

Lei Han (2011), described interpersonal communication as the process we use to build relationships with others through communication by effectively doing the following:

- ☐ Understanding the other's situation – in order to build a relationship with someone, we need to be aware of where the other person is coming from.
- ☐ Communicating in the right manner – it's not just what we say that matters but also the tone we use and how we say it. Additionally, by considering our understanding of the other person, we figure out how to best our intentions and ideas to that particular individual.
- ☐ Influencing them to listen and/or take action as needed – People are more likely to listen to us when we listen first to them and make efforts to establish common grounds. When we approach any communication with the intention to create a win-win situation, that's when we will maximize our influence on others and inspire them to action.

Interpersonal communication includes face-to-face communication, but it can also include other forms of communication, like instant messaging, exchanging email messages, and "talking" via online chat rooms. What's important is that each communicator responds to the other as a "you," not as an "it." It can serve many advantageous purposes. It allows us to influence the behavior, attitudes, and opinions of others. It allows for more effective, efficient cooperation, and can help us forge or maintain a social bond. It can help us learn, and relate to

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 30, 2019
			Page	Page 7 of 16

the problems or situations that other individuals face. Interpersonal information can help us negotiate, ask for help, offer aid, ask forgiveness, apologize, or achieve reconciliation. We may also use interpersonal communication in order to relax and play (<http://www.enotes.com/homework-help/what-advantages-disadvantages-interpersonal-763097>, retrieved: November 2021).

Another advantage of interpersonal communication is the fact that you can create relationships with other people while being able to understand and maintain them. If you do not have the ability to have interpersonal skills then you will struggle to express any feelings or emotions with people as well as empathize with various situations.

There are a huge number of ways to communicate with people but the main skill that you need to have in order to form lasting friendships and relationships is interpersonal skills. Being able to relate to a person and understand their feelings is vital in relationships. To have this form of communication will help you to maintain a link with this person or even end a relationship if needs be. Everyone is aware of the fact that people can form different degrees of relationships with people. These include, friendly, professional and romantic relationships, but to name a few. Having the ability to convey interpersonal skills allows individuals to form and maintain these particular relationships. These skills allow you to adapt to certain people and know how to interact with them on the basis of your relationship with them (<http://science.blurtit.com/1416236/what-are-the-advantages-of-interpersonal-communication>, retrieved November 2021).

What we say is an important way of getting our message across but using our voice is only the tip of the iceberg. We actually communicate more information using non-verbal signals, gestures, facial expression, body language even our appearance (<https://www.linkedin.com/pulse/importance-interpersonal-communication-skills-communication>, retrieved: June 2022).

Listening is a vital interpersonal communication skill. When we communicate we spend 45% of our time listening. Most people take listening for granted but it is not the same as hearing and should be thought of as a skill. It is often desirable to build strong relationships with others, which can in turn lead to better communication and understanding (<https://www.linkedin.com/pulse/importance-interpersonal-communication-skills-communication>, retrieved: June 2022).

Good interpersonal communication skills enable us to work more effectively in groups and teams, which may be either formal, like at work, or informally - in social situations. Interpersonal communication skills are essential to developing other key life skills. Being able to communicate well with others is often essential to solving problems that inevitably occur both in our private and professional lives. Decision making is another area which can benefit from good communication skills as it often requires communicating complex information so that the most appropriate decision can be made. (<https://www.linkedin.com/pulse/importance-interpersonal-communication-skills-communication>, retrieved: June, 2022).

Ambrosio (2012), noted that interpersonal communication — direct face-to-face dialogue — has long been known to be the most effective form of communication. Interpersonal communication is important because it helps a person communicate well and interact with others effectively within the workplace. Developing good interpersonal communication skills allows a person to engage with others productively at different levels. For effective interpersonal communication, a person should consider key areas, such as emotions, needs, values, personality and habits of others. Taking into account the internal state of an individual helps in communicating effectively with other people. Being relaxed and positive also helps with better communication. Listening to the opinions of other people is also key to good interpersonal skills (<https://www.reference.com/business-finance/interpersonal-communication-important-358130d84a303cf7>, retrieved: November 2016).

Synthesis

Covid-19 Pandemic has really brought great change to everyone's lives in all aspects. In terms of education, higher education systems in the country and abroad have come to embrace online learning as the new way of teaching and learning. Use of different learning modality system and online platforms with the help of internet and other technology advancement served vital role in continuing education worldwide.

It could not be denied that the abrupt shift in the system of learning has brought many positive and negative influence to communications skills of students. Everyone was caught off guarded since not all was ready

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 30, 2019
			Page	Page 8 of 16

and well equipped to face the sudden change. In some instances, online learning brought many possibilities and opportunities to the lives of students thus the new set up brought them positive feedback and experiences. On the other hand, there were also others whose communication skills have greatly affected in negative way thus online learning has become a trouble and burdensome.

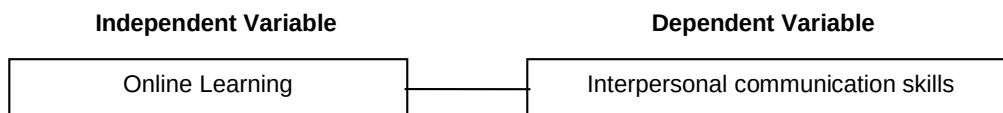

There are indeed many factors that shape students interpersonal communication in online learning. Each influence depends on every life circumstances of individual learners. There are factors that can be controlled and cannot be controlled. The way they deal, face and accept the challenges to this new method of learning lies success or failure to acquire learning, finished education and achieve personal goal in life.

. Students should value interpersonal communication for it promotes social bond and strong relationship to one another. It makes people connected and united. If we have interpersonal skills it is very easy to understand each other. Interpersonal communication is also vital in virtual classroom setting. It help reduce the erected barriers among diverse learners and encourage them to have cooperation and teamwork. It is one of the key skills that will help student to become successful in every endeavor they may have.

(12) Scientific Basis/Theoretical Framework (Include concepts, theories and variables that indicate relevant relationships to be tested.

This study is anchored on Theory of Computer Mediated Communication (CMC). CMC can cause many changes in the way people communicate with one another, and it can influence communication patterns and social networks (e.g., Fulk & Collins-Jarvis, 2001). In other words, CMC leads to social effects. Rice & Gattiker (2001) state that CMC differs from face-to-face communication. CMC limits the level of synchronicity of interaction, which may cause a reduction of interactivity. Furthermore, CMC can overcome time- and space dependencies. Together with these arguments the overall use of using CMC results in multiple differences with face-to-face communication.

This study is also anchored on the Theory of Self-efficacy which claims that “people’s belief about their capability to realize a goal influences the way they approach tasks”. According to Bandura (1977) students having robust self-efficacy owns advanced level of self-confidence to express themselves in online/virtual classrooms, where those who have weaker self-efficacy may not, as they fear rejection from the network established members this level of self-efficacy can exacerbate a student sense of isolation.

(13) Methodology (Details such as; a) variables to be measured and evaluated; b) treatments to be used and their layout; c) experimental procedures and design; d) statistical analysis; e) evaluation method and observations to be made, strategies for implementation.)

Purpose of the Study and Research Design

The proposed research aims to determine the influence of online learning to the interpersonal communication skills of the students. This study will employ the survey-correlational method of research. Fraenkel and Wallen (2006) described this method as the process of collecting data to test a hypothesis or to answer questions concerning the current status of the subject of the study.

The independent variable in the study is the online learning while the dependent variable is the interpersonal communication skills.

Methods

Participants

The participants of this study will be the randomly selected engineering and architecture students of Capiz State University – Roxas City.

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
	Document Title:	RESEARCH PROPOSAL	Revision No.	00
			Effective Date	November 30, 2019
			Page	Page 9 of 16

The desired sample size will be determined using the formula of Slovin.

Data-Gathering Instruments

Personal Data Sheet (PDS). The personal data needed for the study will be gathered using a researcher-made questionnaire-survey form to gather the information of the participants.

Online Learning Questionnaire. Another researcher-made questionnaire which aimed to find out about the respondents' mode of online learning (synchronous/asynchronous), online learning platform used, time spent daily in online learning.

Interpersonal Skills Questionnaire. It is a standardized Communication Skills Questionnaire adopted from (<http://psychologytoday.tests.psychtests.com>) which measured the interpersonal skills of the respondents. The responses were 5 (most of the time), 4 (often), 3 (sometimes), 2 (rarely) and 1 (almost never). The following scale of means was used to interpret their interpersonal skills:

Scale	Interpretation
4.21 – 5.00	very high
3.41 – 4.20	high
2.61 – 3.40	moderate
1.81 – 2.60	low
1.00 – 1.80	very low

Data-Gathering Procedures

The study will be conducted during the first semester of the school year 2022-2023. Researcher-made questionnaires will be prepared by the researcher to gather the information on the participants' age, sex, parents' educational attainment, parents' work location, daily allowance, profile/account in social network, time spent in social network daily and reasons of exposure of students in social networks. Standardized questionnaires to measure intrapersonal and interpersonal communication skills were utilized. The data gathered was analyzed using the Statistical Package for Social Science Software (SPSS).

Statistical Data Analysis Procedure

The gathered data were subjected to computer-processing using the Statistical Package for Social Science (SPSS) as follows:

Mean. This test will be used to describe interpersonal communication skills of the students.

Standard deviation. This test will be used to describe the homogeneity and heterogeneity of the abovementioned variables.

t-test for independent samples. This test will be to determine the significant difference between two-category variables.

Pearson r. Set at .05 alpha of significance, this test was used to determine the significance of the relationships among online learning, and interpersonal skills.

Interpersonal Communication Skills Questionnaire

Instruction: This survey is intended to help you assess your interpersonal communication skills. Please put a check on the response that fit you best.

No.	Questions	Most of the Time	Often	Some-times	Rarely	Almost Never
1	I can detect the mood of others by looking at them as we converse.					
2	I find it easy to see things from someone else's point of view.					
3	I put myself in someone's shoes when I talk to him/her.					
4	I can tell when someone doesn't understand what I'm saying.					
5	I pay attention to the body language when talking to people, I (ex. Facial expression, hand movement, etc.).					
6	manage to express my ideas clearly.					
7	I feel free to politely voice my disagreement with someone in a position of authority.					
8	I am completely at ease when a conversation shifts to the topic of feelings.					
9	I think people don't get what I am saying.					
10	I finish the sentence for someone when I know what he/she is going to say,					
11	Emotionally charged situations make me uncomfortable.					
12	People tend to misinterpret what I say.					
13	I find it hard to express my feelings to others.					
14	I have difficulty putting my thoughts into words.					
15	I have to repeat myself often because people don't understand my message the first time around.					
16	I don't understand someone's explanation the first time around. I feel stupid asking for clarifications.					
17	I tend to postpone or avoid discussing touch topics.					
18	I find it difficult to express my opinions when others don't share them.

19	I tend to clam up when dealing with someone I find intimidating.					
20	I try to divert or end conversations that don't interest me					
21	If I have something relevant to add, I'll interrupt someone to make certain my views are heard.					
22	I will stop a speaker in mid-sentence if I disagree with a statement he or she has made.					
23	I am uncomfortable id I'm not leading the conversation (ex. Choosing the topic, controlling the pace).					
24	I'm better off hiding my weakness so that no one will use against me.					
25	I'm not sure how to react when other people become emotional around me,

Survey Questionnaire

This survey is being conducted for the research regarding “**Influence of Online Learning on the Interpersonal Communication Skills of Students.**” Your participation will greatly help to obtain the results.

Below are the items on the profile of the respondents. Please fill out the following information needed and put a check mark on the blank provided before each item that is applicable to you.

A. Profile of the Respondents.

Name: _____ Year & Section: _____

1. Gender

☐ Male

☐ Female

Others: _____

2. Age: _____

3. Location

☐ Local

☐ Abroad

B. Online Learning Questionnaire

Adapted from:

<https://www.surveymonkey.com/r/LMWLMLS>, retrieved: Aug. 2022

1. Please select the mode of online learning.

☐ Synchronous

☐ Asynchronous

2. What technology do you use during online class? (You can choose more than one.)

☐ PC/Desktop

☐ Smartphone

☐ Laptop

☐ iPod/iPad/Tablet

Others: (please specify) _____

3. On average, how much time do you spend on online class per course/subject?

☐ 30 minutes

☐ 1 hour

☐ 45 minutes

☐ More than 1 hour

4. On average, how much time do you spend on online class per day?

☐ Less than 1 hour

☐ 3 to 4 hrs per day

☐ 1 to 2 hrs per day

☐ More than 4 hrs
