

I.	PROJECT TITLE:	Livelihood Program For Urban Areas Through Small Space Hydroponics Farming
II.	PROPONENTS:	Rogie O. Dadivas, Rimark Camulo, Ian Arcega, Maria Sheila Simon, Gemma Angelias
III	SUMMARY	The proposed study attempts to promote a method of doing gardening to the people living in densely populated areas and how to plant in small spaces using hydroponics. Following implementation, a series of seminars will instruct and support the respondents in growing various plants hydroponically, including lettuce and cherry tomatoes. Additionally, the proposed study will cover market access techniques that would enable the respondents to profit from this style of gardening. Small-space and easy backyard gardening would be a fantastic solution to the ongoing issue in the nation. Philippines is an agricultural country. The number of Filipinos who are considering careers in agriculture is, however, declining. Although this method is currently employed outside the country and in a few locations in the Philippines, Capiz is not yet a highly popular place to apply it. A way of growing plants without soil is called hydroponic gardening, according to Scotts Miracle-Gro, an online resource for agriculture. It's a way to nurture a huge variety of edible plants indoors all year round, regardless of what is the weather outside one's door. As long as there is sunlight, a hydroponic system may be used almost any place, and plants will actually grow quicker than they would in an outdoor garden. giving poor Filipino families a second source of income through hydroponic farming.
IV	RATIONALE/ BACKGROUND	(Why should the project be implemented?) Nowadays, pollution is rampant, and virtually every food product on the market, including meats and vegetables, is processed and synthetically cultivated. As a matter of fact, the Department of Health reported that cardiovascular disease is the leading cause of all fatalities in the Philippines, making it tougher than ever to live a healthy lifestyle. This is a particular illness that, according to the CDC, is frequently brought on by poor lifestyle choices, including eating behaviors and insufficient physical exercise. Having said that, encouraging agriculture, especially backyard gardening, would be a great answer to the country's persistent problem. The Philippines is, in fact, an agricultural nation. However, the number of Filipinos who are interested in working in agriculture is decreasing. This occurs as a result of the many duties and priorities they must attend to. Fortunately for us, we haven't completely abandoned agriculture; this was seen even during the Covid-19 outbreak, when the majority of Filipinos were compelled to go into lockdown. Home gardening has become a popular activity, and those who do it refer to themselves as "Plantitos" and "Plantitas." However, most of the plants that these Filipinos grew were not edible and were just grown for show, as a source of comfort during the epidemic, and presumably for social media. The suggested study will assist in addressing this. The introduction of this ground-breaking gardening method would enable Filipinos to produce their own organic, pesticide-free veggies in the convenience of their homes, apartments, and even boarding houses, even in the most urbanized areas! Plantitos and Plantitas will no longer require a sizable backyard to engage in their pastime thanks to the proposed initiative, and they will be more knowledgeable about what to plant instead of the typical non-vegetative plants.
V	OBJECTIVES	(What do you want to achieve?) 1. Promote the cultivation of vegetables through hydroponics farming; 2. Instill the value of farming and wise utilization of space profitability; 3. Promote the significance of farming organic and pesticide-free vegetables.

VI	ACTIVITIES	(What will you do?)
		Activities
		1 CREATE A COLABORATIVE AGREEMENT FROM THE CEXTENSION OFFICE FROM CAPSU – MAMBUSAO CAMPUS 1.1 Establish a collaboration in implementing study. 1.2 Seek assistance and expertise from the Capiz State University – Mambusao campus particularly for the workshops and trainings to be conducted with the participants of the study.
		2 COORDINATE WITH THE BARANGAY OFFICIALS AND COMMUNITY LEADERS
		3 CONDUCT SEMINAR WORKSHOP AND ORIENTATION ACTIVITIES 3.1 Select/Identify project responder for this study 3.2 The respondents are introduced to the idea of hydroponics Kratky design, as well as the materials required, such as old tiny soft drink plastic bottles, Styrofoam boxes, and Styro-cups, and their DIY counterparts. 3.3 Conduct various seminars, workshops, and training about hydroponic farming and market distribution strategies.
		4 IMPLEMENTATION OF THE PROJECT 4.1 help the respondents with the farming process' germination stage. It will take the plant 1-2 weeks to complete this stage. 4.2 the proponent will help the respondents in the establishment of the garden from sowing, transplanting and harvesting. This stage will take about 3 weeks. By the end of this stage, the respondents can already begin to look for prospect market 4.3 Harvest and sell of the collected vegetables. By assisting the respondents in selling the products. The proponent was able to provide them additional source of income or a livelihood program. 4.4 the plants will now be transferred to a 100% nutrient solution/ltr ratio. This can take another 3 weeks and will be ready for harvest.
		5 MONITORING AND FEEDBACKING 5.1 The proponent will conduct quarterly and/or random follow-up visits to monitor the continuity of the project and to provide additional knowledge and skills set that can be adapted for a more effective and efficient hydroponic farming.
		6 PROCESS AND ANALYZE THE GATHERED DATA 6.1 The level of knowledge and appreciation of the respondents towards agriculture particularly of hydroponic farming. This will be done through conduct of random survey questionnaire and feedback forms; 6.2 The total agricultural process' success rate. This will be accomplished by thoroughly documenting each respondent's gardening activities, including the quantity of seeds sown initially compared to the quantity of vegetables collected. 6.3 The respondents' degree of confidence and ability to market the collected goods. This will be accomplished by contrasting the anticipated sales revenue and anticipated costs with the actual sales and outlay of funds. 6.4 The proponent will be conducting the measurement of the stated aspects before, during and after the implementation to create trend and basis for comparison.

VII	WORK PLAN	(How will you achieve your objectives?) <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <th colspan="9" style="text-align: center;">Work plan</th></tr> <tr> <th rowspan="2" style="text-align: center;">Activities</th><th colspan="8" style="text-align: center;">(Year 2022-2023)</th></tr> <tr> <th style="text-align: center;">NOV</th><th style="text-align: center;">DEC</th><th style="text-align: center;">JAN</th><th style="text-align: center;">FEB</th><th style="text-align: center;">MAR</th><th style="text-align: center;">APR</th><th style="text-align: center;">MAY</th><th style="text-align: center;">JUN</th></tr> <tr> <td>1. Activities	(Year 2022-2023)																																																																								
	NOV	DEC	JAN	FEB	MAR	APR	MAY	JUN																																																																	
1. Coordinate with the barangay officials and community leaders																																																																									
2. Conduct seminar workshop and orientation activities																																																																									
3. Implementation of the project																																																																									
4. Monitoring and feedbacking																																																																									
5. Process and analyze the gathered data																																																																									
VIII	OUTPUTS AND IMPACTS	(Who will be better off at the end of the project and why?) The Barangay 1, community of Roxas City will be the primary beneficiary of this study. (Model of Mini-Greenhouse will be established in the identified location) • Respondents or the residents of Brgy 1, Roxas City, Capiz. After the implementation of the study, the proponent expects them to have a keen appreciation of agriculture, particularly of hydroponics; • Health enthusiasts in Roxas City. Since healthy lifestyle awareness, is gradually increasing in the city, demand for healthier sources of food is also increasing. Hence the products this study will greatly benefit this group of individuals as it can supply them with organic and pesticide-free products; • Society. In the modern age, where forests are being converted into malls or subdivisions, it is fragile that we continue planting regardless of how small or how urbanized the area is. Through this study, the people living in urbanized places will be encouraged to engage in planting which will greatly benefit our society; and • Future researchers. Hydroponics is a complex concept and indeed requires further research. To begin, other researchers can focus on trying other varieties of plants to identify the survivability rate of the plant in this farming method or to identify if the light from an artificial source other than the sun can support the plant.																																																																							
IX	MONITORING AND EVALUATION	(How will you test if the project is working?) Proper coordination and monitoring shall start fifteen days (15) days after the launching of the project, and every 1 month thereafter for the duration of 2 years. The Barangay Council, Community leaders and Capiz State University Main Campus Extension Coordinators will do the monitoring. The results of monitoring will be presented and discussed to the project management team.																																																																							
X	BUDGET	(How much will it cost?) <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <th style="text-align: left;">SOURCES OF EXPENSES/ Activities to be conducted</th><th style="text-align: center;">Amount (PhP)</th></tr> <tr> <td>1.
