(9) Rationale

The CoViD-19 pandemic brought about many changes in the educational landscape in terms of its delivery, method and strategies particularly in teaching and learning. This perspective of education captured an emergency shift from the traditional course into remote learning such as modular approach which does not exclude the teaching of Adapted Physical Education. The Adapted Physical Education National Standards (APENS) define adapted PE as physical education that has been adapted or changed to be as appropriate for people with disabilities as it is for those without disabilities (APENS, 2008).

Physical Education, which is defined as the development of (1) physical and motor skills (2) fundamental motor skills and patterns, is mandated by Republic Act 5708, also known as "The Schools Physical Education and Sports Development Act of 1969" (throwing, catching, walking, running, etc) (3) abilities in swimming, dancing, and solo and group activities and sports (including intramural and lifetime sports). This does not apply to children who are currently enrolled in elementary school and have disabilities.

(9-A) Project Description

There is a trend toward implementing education in modules these days. The concept has gotten a lot of attention in the education systems of most countries, especially in technical and vocational education and higher education (Malik, 2012). Hence, the purpose of this study is to have an in-depth analysis of the teaching needs of special education teachers in the context of modular distance learning in terms of content, activities and assessment especially in teaching perceptual motor skills. Since adapted physical education is of major focus of this study, special education teachers are primarily needed as the participants since they are the focal persons when special education is concerned. The end goal of this research is to provide these teachers a module that will serve as an instructional guide on how to deliver Adapted Physical Education specifically perceptual motor skills in the different approaches of remote learning to the different levels of learners in this challenging time of pandemic. This will be a developmental research to particularly address the basic questions of why, how and whom of teaching Adapted Physical Education. This required a cyclical process of small-scale-in-depth construction and evaluation of example teaching-learning sequences at a content-specific level.

(10) Objectives/Statement of the Problem

Generally, this study will be focused towards the development of a module in Perceptual Motor Skills that will serve as an instructional guide for teachers. Specifically, this study will seek to achieve the following:

1. to determine the teaching needs of special education teachers in terms of content, activities and assessment in teaching adapted physical education particularly the topic of perceptual motor skills;
2. to develop a module in Perceptual Motor Skills incorporating the competency standards by the Department of Education and
3. to evaluate the module in teaching perceptual motor skills.

(11) Review of Literature/Prior Art Search

Adapted Physical Activity through COVID-19

Kwok Ng mentioned this most recent item in April 2020. The COVID-19 pandemic has impacted everyone in some way, but especially those groups identified as vulnerable or at risk, such as people with disabilities. At the time of writing, the number of cases and deaths in most parts of the world continues to rise, resulting in the worst pandemic in over a century. Chinese government released the COVID-19 genetic sequence on January 12, 2020. (WHO, 2020). Since then, there has been a surge in collaborative research around the world to answer some of the most pressing questions about COVID-19 transmission between humans, infection symptoms, virus carriage in sewage, methods to test and diagnose COVID-19, appropriate treatments for infected individuals, vaccine development, and better understanding the virus (Yuen, Ye, Fung, Chan, & Jin, 2020). Despite the global economic and vocational crises, people from all over the world continue to gather digitally and produce solutions through weekly hackathons, accelerating traditional research and development methods. Meanwhile, the majority of the population is experiencing less physical interaction as a result of social alienation and the closing of public meetings such as sporting events, concerts, restaurants, and schools. This has put a significant strain on families, as parents and

			Page	Page 3 of 5

children must now spend the entire day together at home, rather than taking the 'usual' commute to work and school. Despite such significant alterations in everyone's routine, whether sick or not, authorities have paid little attention to this behavioral element, particularly in terms of PA promotion, let alone adaptive physical activity (APA).

Finding a Home for Adapted Physical Education in Individualized Education Program Software

Scott McNamara and Suzanna Dillon conducted this research in March 2019. The goal of their research was to see how IEP software addresses physical education and APE services across the United States, and to what extent these programs are already provided. Representatives of IEP software businesses that provide IEP software to school districts around the United States were polled for this study. Although previous research has shown that IEP software is becoming more popular and has a variety of benefits and limitations (Bonner, 2017; More & Hart, 2013, 2014), this was the first study to look at how IEP software is addressing the needs of a specific educational area (i.e., APE) within special education (Bonner, 2017; More & Hart, 2013, 2014).

Cognitive interviews with children as a research tool for instrument validation in adapted physical activity

Nancy L. I. Spencer, Marcel Bouffard, and E. Jane Watkinson conducted this research in January 2019. The research identified the instrument's sources of validity and invalidity. There were differences and concerns in the children's understanding of questions and word interpretation, which could lead to restricted and varied sources of information for response production. Topic sensitivity and limited response possibilities were prevalent constraints, even though judgment appeared to be unproblematic. The information gathered in this study could be used to improve the instrument.

In the field of Adapted Physical Activity, the development and use of measures to assess individuals with impairments in multiple domains is routine practice. Test developers and users frequently doubt the validity of their instruments and employ various conceptual and/or empirical validation procedures. Cognitive interviews with participants are one validation approach that is currently infrequently employed in sport science. This study aims to demonstrate the value of cognitive interviews in the creation of instruments with children in the field of adaptive physical exercise. We studied the question-and-answer procedures of children with disabilities when answering to Harte's (1985) Self-Perception Profile for Children's Athletic Competence Domain Subscale. In cognitive interviews, eight children with various disorders (ages 8-13 years) took part.

(12) Scientific Basis/Theoretical Framework

This study will be anchored on two theories: (1) the Theory of Instructional Scaffolding by Lev Vygotsky (1896-1934) - a teaching approach in which pupils collaborate with a teacher or a more advanced student to attain their learning objectives. The premise underlying instructional scaffolding is that students learn more when they collaborate with people who have a wider range of skills and knowledge than they do when they learn alone. The educational idea of "Zone of Proximal Development," or ZPD, includes Vygotsky scaffolding. The ZPD is a set of abilities or information that though a student cannot learn on her own, she can learn with the help of others or instruction of another person. It's the skill level immediately above the student's current level; and (2) David Kolb's (1984) Theory of Experiential Learning, which is described as the process by which knowledge is formed by transforming experience. The result of a mix of grasping and converting experience is knowledge.

(13) Methodology

In this study, the developmental research approach for instructional module will be used, in which the research will be combined in the development process (Ritchey, 1997). Throughout the study, the Input-Process-Output (IPO) Model will be utilized. According to American Psychological Association (APA), IPO Model is a functional graph that identifies the inputs, outputs and required processing task required to transform the inputs into outputs. The inputs represent the flow of data and materials into the process from the outside. The processing step includes all tasks required to effect a transformation of the inputs. The outputs are the data and materials flowing out of the transformation process (Bisk, 2020).

An interview guide for the focus group discussion in determining the teaching needs of the Special

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01

			Page	Page 4 of 5

Education Teachers in terms of content, activities and assessment will be utilized by the researchers. This interview guide will be validated by two (2) Physical Education experts and two (2) Special Education experts using evaluation tool.

Data Gathering Procedures

The first step in the IPO Model is Input. Input step involves:

- Focus Group Discussion that determines the experiences and teaching needs of the Special Education teachers in terms of content, activities and assessment via zoom.
- Consultation from Special Education and Physical Education experts.

The second step in the IPO Model is Process. Process step involves:

- Development of the module based on the competency standards of the Department of Education.
- Design and lay-out of the module.

The third step in the IPO Model is Output. Output involves:

- Evaluation of the teaching module by two (2) SpEd experts and two (2) Physical Education experts.
- Quality Assurance of the Module

(14) Major Activities/Work plan

Research Objectives	Year 1									Year 2	
	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun		
1. Teaching Needs Analysis											
2. Module Development											
3. Module Evaluation											

(15) Expected Output

- Module in Perceptual Motor Skills

(15) Technology Transfer Activity Design (Indicate the specific products, activity design, processes or services to be transferred as extension activities)

N/A
