(9A) Abstract

This survey-correlational research design aimed to find out the pseudoscientific beliefs on behavior and culture of people. The participants of the study were the one hundred fifty-six (156), out of six hundred forty-eight people of Brgy. Carataya, Cuartero, Capiz and eight (8) participants were involved in the Focus Group Discussion. Data in this study were gathered using the researcher-made questionnaires for Pseudoscientific Beliefs, Behavior and Culture. The independent variable of the study was pseudoscientific belief while the dependent variables were behavior and culture. The statistical tools that were used in analyzing and interpreting the data were mean, standard deviation, Paired t-test and Pearson r. All inferential tests were set as .05 alpha level. The findings of the study revealed that generally, the pseudoscientific beliefs were moderate, the pseudoscientific beliefs on behavior were moderate, and the pseudoscientific beliefs on culture was also moderate. There was a significant difference in pseudoscientific beliefs on behavior and culture. There was a significant relationship between the pseudoscientific beliefs on behavior and pseudoscientific beliefs on culture.

(9B) Keywords

Behavior, Culture, Pseudoscientific Beliefs

(10) Introduction

Tolerance to uncertainty regarding the future is conditioned and moderated by the degree of control that the individual perceives over what happens in the environment. The spread of misinformation and fake news about science and health can lead to confusion and mistrust among the public, making it more difficult to promote scientific literacy.

The International Association for the Evaluation of Educational Achievement (IEA) found that only 1 in 10 Filipino high school students could correctly answer questions related to basic scientific concepts. Another study by the Philippine Institute for Development Studies (PIDS) found that only 27% of Filipinos have a good understanding of what science is, and only 21% have a good understanding of what technology is.

The word "pseudo" means fake, and the surest way to spot a fake is to know as much as possible about the real thing. As a science teacher, the researcher, has observed that there are several pseudoscientific beliefs that exist that people tend to take it as pure science. People really believe in science and its products but there are also some concepts of science which can be said as pseudoscience that can lead to some changes in a person's action and decision.

According to Lilienfeld (2007), another reason why people find pseudoscience plausible is a cognitive ability to see relationships that do not exist. They have an adaptive reflex to make sense of the world, and there is a strong motivation to do this. He further advises citizens to consider how pseudoscientific beliefs pose concrete threats by weakening critical thinking and minimizing a person's sense of control and responsibility.

As stated by Gans and Lynd (2008), people believe in things like astrology because it works for them better than anything else and a person's own system is the most efficient one.

Behaviors are not static, and people are continually adapting behaviors for myriad reasons. Indeed, even on environmental issues, people constantly take action and behave in

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 3 of 10

certain ways – although those ways may not always reflect the most appropriate or effective environmental choice (Clover, 2008).

Culture on the other hand, is a shared patterns of behaviors and interactions, cognitive constructs and understanding that are learned by socialization. Thus, it can be seen as the growth of a group identity fostered by social patterns unique to the group. It encompasses religion, food, what we wear, how we wear it, our language, marriage, music, what we believe is right or wrong, how we sit at the table, how we greet visitors, how we behave with loved ones, and a million other things (De Rossi, 2009).

The observation and personal experience of the researcher prompted to further scrutinize the possible pseudoscientific beliefs on behavior and culture of people and at the same time to enlighten the wrong connotations associated to it.

Finally, this study aimed to find out the pseudoscientific beliefs on behavior and culture of people. More specifically, it sought to provide answers to the following questions:

1. What is the level of pseudoscientific beliefs of people?
2. What is the level of pseudoscientific beliefs on behavior of people?
3. What is the level of pseudoscientific beliefs on culture of people?
4. Is there a significant difference in the pseudoscientific beliefs on behavior of people?
5. Is there a significant difference in the pseudoscientific beliefs on culture of people?
6. Is there a significant relationship between the pseudoscientific beliefs on behavior and culture of people?

(11) Materials and Methods or Methodology

This study utilized the survey-correlational research design and Focus Group Discussion (FGD).

Pseudoscientific Beliefs Researcher-made Questionnaire. The pseudoscientific beliefs were assessed using a 25 items pseudoscientific beliefs questionnaire consisting of statements involving the extent to which common pseudoscientific beliefs affect the life of the people. This was responded as Strongly agree (5), Agree (4), Neutral (3), Disagree (2), and sStrongly disagree (1) and interpreted as Very high (4.21-5.00), High (3.41-4.20), Moderate (2.61-3.40), Low (1.81-2.60) and Very Low (1.00-1.80).

Pseudoscientific Behavior Researcher-made Questionnaire. The behavior of people was assessed by using the 25 items Pseudoscientific Behavior Questionnaire. This was responded to as Very often (4), Often (3), Sometimes (2), and Never (1), and interpreted as Very High (3.41-4.00), High (3.81-3.40), Moderate (2.21-2.80), Low (1.61-2.20) Very Low (1.00-1.60).

Pseudoscientific Culture Researcher-made Questionnaire. The culture of people was assessed by using the Pseudoscientific Culture Researcher-made Questionnaire. The questionnaire consists of 15 items regarding the extent to which beliefs affect the culture of people. This was responded as Very often (4), Often (3), Sometimes (2), and Never (1), and interpreted as Very High (3.41-4.00), High (3.81-3.40), Moderate (2.21-2.80), Low (1.61-2.20) Very Low (1.00-1.60).

Focus Group Discussion (FGD) Guide. The qualitative data needed in the study was gathered using the Focus Group Discussion Guide. Five (5) open-ended questions were constructed to gather the responses of the people.

1. Ano nga mga disparatis ang imu ginapatihan? (What are the pseudoscientific beliefs that you believe in?)
2. Gina-ubra/gina-sunod mo ni nga mga disparatis? (Did you practice these pseudoscientific beliefs?)
3. Na-impluwensyahan bala sang disparatis ang imu pamatasan? Paano? (Is your behavior being influenced by pseudoscientific beliefs? How?)

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 4 of 10

4. Na impluwensyahan bala sang disparatis ang inyo kultura? Paano? (Is your culture being influenced by pseudoscientific beliefs? How?)
5. (Ano pa ang inyo gusto ihambal parti sa aton topiko?) (Is there anything else you'd like to say or share about the topic?)

The statistical tools used in data analysis are mean, standard deviation, Paired t-test and Pearson r. All inferential tests were set as .05 alpha level.

(12) Results and Discussions

Level of Pseudoscientific Beliefs

The pseudoscientific beliefs are shown in Table 1. Generally, the level of pseudoscientific beliefs is "moderate" ($M = 3.34$, $SD = 0.48$). This means that people are moderately practicing pseudoscientific beliefs.

The moderate pseudoscientific beliefs of the people are astrology ($M = 3.10$, $SD = 0.60$) and Feng Shui ($M = 3.26$, $SD = 3.26$).

On the other hand, the people practicing high pseudoscientific beliefs are extrasensory perception ($M = 3.48$, $SD = 0.54$) and Alternative Medicine/Aromatherapy/ Faith Healing/Medical ($M = 3.75$, $SD = 0.49$).

This implies that people are still believing and practicing different pseudoscientific beliefs. It can be recognized that these beliefs are moderately evident in them. This observation is seen because most of the people experienced and practiced it. It is also noted that Filipino traditions and customs are still evident nowadays as being transferred by our ancestors to continue these beliefs that even the new generations are learning from it. Moreover, astrology and Feng Shui are moderately evident because these beliefs are experienced occasionally, and other people believed in these but do not practice in their daily living. One of the pieces of information gathered from the local folks that nothing will lose if somebody follows and believe because the choice still lies on situation. On the other hand, beliefs in Extrasensory Perception and Faith Healing are highly evident among the different pseudoscientific beliefs because people always think and believe that these could improve and solve their ways of living.

This finding is supported by the statements of the local folks in the focus group discussion.

Discussant 2 stated that *"gapati ako nga ang horoscope nga naka-angut man kis-a sa personalidad sang tawo. Kag sa mga alien kay mahilig ko sa Sci-Fi."* It also supports the statement of discussant 8 that *"gapati ko nga dapat ibutang sa sakto nga posisyon ang mga gamit sa balay."*

(I believe that the personality of a person is governed by astrology. I also believe in the existence of alien because I am fond of watching Sci-Fi movies.)

It was mentioned by discussant 1 that *"gapati ako nga matugma sang mga mediko/albularyo ang mga balatian. Gapati man ako sa espiritu nga nagatuhaw."* However, it was contradicted by the discussant 3 that *"subung nga tini-on daw wala na ko ga pati sa mga beliefs nga ina."*

(I believe that a quack doctor or herbalist can guess my illness and can explain the existence of the spirits.)

Table 1. Mean and Standard Deviation of the Pseudoscientific Beliefs

Variables	Mean	Description	SD
Overall Pseudoscience Beliefs	3.34	Moderate	0.48
Astrology	3.10	Moderate	0.60
Extrasensory Perception	3.48	High	0.54
Alternative medicine/Faith healing/medical	3.75	High	0.49
Feng Shui	3.26	Moderate	3.26

			Effective Date	
			Page	Page 5 of 10

Scale	Description
4.21-5.00	Very high
3.41-4.20	High
2.61-3.40	Moderate
1.81-2.60	Low
1.00-1.80	Very low

Level of Pseudoscientific Beliefs on Behavior of People

The level of pseudoscientific beliefs on behavior of people is shown in Table 3. Generally, the level of pseudoscientific beliefs on behavior is “moderate” ($M = 2.61$, $SD = 0.50$).

Furthermore, the level of astrology on the behavior is “moderate” ($M = 2.38$, $SD = 0.64$), level of extrasensory perception on behavior is “moderate” ($M = 2.73$, $SD = 0.62$), level of Alternative Medicine/Aromatherapy/ Faith Healing/Medical on behavior is “high” ($M = 2.89$, $SD = 0.53$) and level of Feng Shui on behavior is “moderate” ($M = 2.66$, $SD = 0.58$).

This implies that the level of pseudoscientific beliefs on behavior of people is moderate. The decision making of an individual is intervened because these make them think if they will practice a certain belief or not. The levels of their belief vary depending on what kind of pseudoscience it is. Beliefs in astrology, extrasensory perception, and Feng shui are moderate because other people are aware of it but certainly do not follow and believe in these. People have their own belief that they prefer or follow. The young generation are not even aware of other beliefs which are commonly done by the old ones because their behavior is primarily influenced by technology specifically on what they have seen on social media. On the other hand, belief on faith healing is high because people often consult the “*albularyo*” if they suffer from body pain before consulting the medication of the doctor. The strong belief of the local folks that they will be healed by the power of prayer with the application of herbal medicines and oils for therapeutic purposes are evident in them.

This finding is supported by the statements of the local folks in the focus group discussion.

It is supported by the statement of discussant 1 that “*ang iban nga mga disparatis ginasunod man nakun kag naka apekto ina sa akon nga desisyon kag pangabuhi.*”

(Yes, it has been influenced by pseudoscientific beliefs. I observe and practice other kinds of beliefs and these affect my decision making and ways of living.)

Furthermore, the result supports the findings of Hansson (2008) that despite failing to meet proper scientific standards, many pseudosciences survive. This is usually due to a persistent core of devotees who refuse to accept scientific criticism of their beliefs, or due to popular misconceptions. Sheer popularity is also a factor, as is attested by astrology, which remains popular despite being rejected by a large majority of scientists.

Table 2. Mean and Standard Deviation of the Pseudoscientific Beliefs on Behavior of People

Variables	Mean	Description	SD
Overall Pseudoscientific beliefs on Behavior	2.61	Moderate	0.50
Astrology on Behavior	2.38	Moderate	0.64
Extrasensory Perception on Behavior	2.73	Moderate	0.62
Alternative Medicine/Faith Healing on Behavior	2.89	High	0.53
Feng Shui on Behavior	2.66	Moderate	0.58

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 6 of 10

Scale	Description
3.41-4.00	Very high
2.81-3.40	High
2.21-2.80	Moderate
1.61-2.20	Low
1.00-1.60	Very low

Level of Pseudoscientific Beliefs on Culture of People

The level of pseudoscientific beliefs on culture of people is shown in Table 4. Generally, the level of pseudoscientific beliefs on culture is “moderate” ($M = 2.39$, $SD = 0.55$).

Moreover, the level of astrology on culture is “moderate” ($M = 2.28$, $SD = 0.72$), level of extrasensory perception on culture is “moderate” ($M = 2.48$, $SD = 0.61$), level of faith healing on culture is “moderate” ($M = 2.38$, $SD = 0.72$, and level of Feng Shui on culture is “moderate” ($M = 2.41$, $SD = 0.61$).

This implies that the level of pseudoscientific beliefs on culture of people is moderate. The practices, habits, and beliefs related to pseudoscience are part of the culture of the people. Filipinos have own identity that can be distinguished from the others. Beliefs in astrology, Extrasensory Perception, Faith Healing and Feng Shui are moderate because the new generation are not familiar of the culture practiced before. It is assumed and observed that most people are aware but not totally practice it. Educated people apply their learning in school that everything must come with the idea of science- where in there is always a scientific explanation for every theory. However, our ancestors transferred and taught us these different pseudoscientific beliefs and their legacy remained as today's generation acquire it but do not necessarily practice.

The result supports the statement of discussant 2 that “kis-a nakaimpluwensya man. Iban nga disparatis wala ko dabi kabalo. Kag nakagawian naman sang mga tawo kag wala man malain kun magpati kag masunod ka kay parti na ina sang kultura naton nga mga Pilipino.”

(Sometimes, it is being influenced. I just do not know about other pseudoscientific beliefs. Anyway, people get used to it and there is nothing wrong if you believe and follow it because it is part of Filipino culture.)

The result also affirms to the ideas and findings of Lilienfeld (2007) that the reason why people find pseudoscience plausible is a cognitive ability to see relationships that do not exist. They have an adaptive reflex to make sense of the world, and there is a strong motivation to do this. He further advises citizens to consider how pseudosciences pose concrete threats by weakening critical thinking and minimizing a person's sense of control and responsibility.

Table 3. Mean and Standard Deviation of the Pseudoscientific Beliefs on Culture of People

Variables	Mean	Description	SD
Overall Pseudoscientific beliefs on Culture	2.39	Moderate	0.55
Astrology on Culture	2.28	Moderate	0.72
Extrasensory Perception on Culture	2.48	Moderate	0.61
Alternative Medicine/Faith Healing on Culture	2.38	Moderate	0.72
Feng Shui on Culture	2.41	Moderate	0.61

2.21-2.80	Moderate
1.61-2.20	Low
1.00-1.60	Very low

Difference in the Pseudoscientific Beliefs on Behavior of People

Generally, data show that there is a significant difference in pseudoscientific beliefs on behavior of people $t = (4.34^*)$, $p = .000 < .05$. Furthermore, data reveal that there is a significant difference in extrasensory perception on behavior $t = 3.89^*$, $p = .000 < .05$, faith healing on behavior $t = 7.88^*$, $p = .000 < .05$, and Feng Shui on behavior $t = 4.34^*$, $p = .000 < .05$. However, there is no significant difference in the astrology on behavior $t = 1.45$, $p = .149 > .05$.

This implies that pseudoscientific beliefs differ on the behavior of people. It is observed that extrasensory perception, faith healing and Feng Shui have significantly differed on behavior because the beliefs of people vary from one another. People might believe other kinds of pseudoscience and have personal explanation and thoughts on how they behave and practice once they experience it while others still stick to what science tells.

On the other hand, it also shows that astrology like horoscope and the position of the stars do not significantly differ on the behavior because this affects them similarly.

The result supports the statement of discussant 3 that *“Wala na ko sina gasunod. Halin dabi sang una muna na ginakagawian sang mga tawo muna asta subung ginatudlo pa. Pero sa akon nga pagpati, indi na dapat pag-sundon ina kay ara man na dyapon sa bakas sang tawo kun paano sa mag-umwad.”*

(I didn't observe that today. Our ancestors taught us these kind of beliefs that some people are still practicing it but in my opinion, it is not necessary to follow because a person needs to work hard in order to be successful.)

Discussant 5 mentioned that *“ginasunod kag ginapatihan gid nakon dabi kapin pa sa pagpanguma nga dapat tapos ugsad manami magtanom. Muna dabi naka gawian halin pa sang una.”*

(I observe and practice those pseudoscientific beliefs especially in farming that planting grains should be done after the full moon and it is really practiced since before.)

Table 4. T-test in the Difference of Pseudoscientific Beliefs on Behavior of People

Variables	Mean	SD	t	df	Sig
Astrology on Behavior	2.38	0.64	1.45	155	.149
Extrasensory Perception on Behavior	2.73	0.62	3.89*	155	.000
Faith Healing on Behavior	2.89	0.53	7.88*	155	.000
Feng Shui on Behavior	2.66	0.58	4.53*	155	.000
Overall Pseudoscientific beliefs on Behavior	2.61	0.50	4.34*	155	.000

* $p < 0.05$ significant @ 5% alpha level

$p > 0.05$ not significant @ 5% alpha level

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 8 of 10

Difference in the Pseudoscientific Beliefs on Culture of People

Table 5 presents the t-test results on the difference in the pseudoscientific beliefs on culture of people. Generally, data show that there is a significant difference in pseudoscientific beliefs on culture of people $t = (4.34^*)$, $p = .000 < .05$.

Furthermore, data revealed that there is a significant difference in extrasensory perception on culture $t = 3.89^*$, $p = .000 < .05$, faith healing on culture $t = 7.88^*$, $p = .000 < .05$, and Feng Shui on culture $t = 4.34^*$, $p = .000 < .05$. However, there is no significant difference in the astrology on culture $t = 1.45$, $p = .149 > .05$.

This implies that pseudoscientific beliefs differ on culture of people. It is observed that extrasensory perception, faith healing and Feng Shui have significantly differed on culture because the beliefs of people vary from one another. Some of the local folks firmly believe in it but others who are millennials do not necessarily practice it. People tend to consider these beliefs as part of Filipino culture, and it must be introduced.

On the other hand, it also shows that astrology is always observed by the local folks that somehow gathering round fruits for they believe that it will give them a prosperous year, but they further explain and emphasize that a person needs to be practical and determined to improve their lives through proper education.

Furthermore, it conforms the ideas of Carroll (2011) that pseudoscientific explanations are generally not analyzed rationally, but instead experientially. Operating within a different set of rules compared to rational thinking, experiential thinking regards an explanation as valid if the explanation is personally functional, satisfying and sufficient, offering a description of the world that may be more personal than can be provided by science and reducing the amount of potential work involved in understanding complex events and outcomes.

Table 5. T-test in the Difference of Pseudoscientific Beliefs on Culture of People

Variables	Mean	SD	t	df	Sig
Astrology on Culture	2.28	0.72	1.45	155	.149
Extrasensory Perception on Culture	2.48	0.61	3.89*	155	.000
Alternative Medicine/ Faith Healing on Culture	2.38	0.72	7.88*	155	.000
Feng Shui on Culture	2.41	0.61	4.53*	155	.000
Overall Pseudoscience on Culture	2.39	0.55	4.34*	155	.000

* $p < 0.05$ significant @ 5% alpha level

$p > 0.05$ not significant @ 5% alpha level

Relationship between the Influences of Pseudoscientific Beliefs on the Behavior and Culture of People

Table 6 shows the significant relationship between the pseudoscientific beliefs on behavior and culture of people. Data reveal that there is a significant relationship between the pseudoscientific beliefs on behavior and pseudoscientific beliefs on culture $r = 0.318^*$, $p = .000 < .05$. Moreover, data also reveal that there is a significant relationship between the astrology on behavior and culture $r = 0.254^*$, $p = .001 < .05$, between faith healing on behavior and culture $r = 0.199^*$, $p = .013 < .05$, and between Feng Shui on behavior and culture $r = 0.290^*$, $p = .000 < .05$. However, there is no significant relationship between the extrasensory perception on the behavior and culture $r = .132$, $p = .100 > .05$.

This implies that pseudoscientific beliefs are related to the behavior and culture of people. It is observed that they rely on and are significantly related to each other. Pseudoscience really affects the day-to-day life of the local folks. The practices and actions of the people are intervened since they think and believe in it. This also indicates that beliefs are being applied in their place, especially in agriculture. Different beliefs related to agriculture are applied for a better harvest to improve their living. Influence of astrology, faith healing and Feng shui are significantly related to the behavior and culture because

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 9 of 10

people often encounter it and the response on these situations are commonly the same.

On the other hand, beliefs on extrasensory perception appear to be not significantly related because other local folks behave differently than in general. Since these pseudoscientific beliefs are part of the culture and behavior of the people, it is thought that nothing will be lost if you believe and practice it. Generally, the result also supports the ideas and information gathered from the local folks that some of the beliefs are being practiced especially those that can help their living but not that evident as compared before

The result supports the statement of discussant 1 that *“ang mga beliefs parti na sang kultura natun. Wala man madula kun magpati kag pagasundon natun.”* (Those pseudoscientific beliefs are part of Filipino culture and nothing will lose if someone will believe and follow.)

It is contradicted by the statement of discussant 3 that *“naka gawian na sang una pero indi sa tanan nga tini-on atun ina pagasundon kay may advantage man kag disadvantage.”* (These are the usual practices since before but not all the time people need to follow because there are advantages and disadvantages.)

Table 6. Pearson r Between Pseudoscientific Beliefs on Behavior and Culture of People

Variables	R	Sig
Astrology on Behavior & Astrology on Culture	0.254*	.001
Extrasensory Perception on Behavior & Extrasensory Perception on Culture	.132	.100
Faith Healing on Behavior & Faith Healing on Culture	0.199*	.013
Feng Shui on Behavior & Feng Shui on Culture	0.290*	.000
Overall Pseudoscientific beliefs on Behavior & Overall Pseudoscientific beliefs on Culture	0.318*	.000

*p<0.05 significant @ 5% alpha level

p>0.05 not significant @ 5% alpha level

(13) Conclusions and Recommendations

Based on the findings of the study, the researcher concludes that the behavior and culture of people are being influenced by their responses and practices on different pseudoscientific beliefs. It can be inferred that these variables are indispensable from each other. It is mainly because once a person observes and believes, he or she is also practicing it. There are pseudoscientific beliefs that people could hardly reject nor forget, especially those beliefs and practices related to agriculture and health. In the same way, internalizing and observing one's behavior and culture through socialization, nature and family orientation can lead to meaningful learning and adaptation. In addition, the moderate pseudoscientific beliefs are an indication that despite of the generation of advanced/modern technology, well-designed gadgets and numerous research, there are some people especially in rural areas who still believe and practice it. Thus, these pseudoscientific beliefs work and influence the behavior of an individual and culture in general. It supports and provides an idea that pseudoscientific beliefs as part of Filipino culture are still existing and being valued until today.

The researcher recommends that instead of giving much attention to the pseudoscientific beliefs, local folks can apply the different products of science to improve their ways of living. Scientific literacy nowadays is important to achieve a better future. Furthermore, to align to the world of research and science, local folks need to be oriented that pseudoscientific beliefs are not a basis in day to day living. It has nothing exist so with the efficiency of living, in contrast with the science and research that exist to explain pseudoscience. It is important to understand the concept of pseudoscience to clear the wrong connotation associated with it by giving emphasis on the value of science and research. Local folks may develop understanding about the current trend of technologies and machinery. In addition, parents may take initiative in making themselves practical through engaging the different products of science to be

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 10 of 10

part of their lives to lessen their burden in many ways. Parents may teach their children on how to make life efficient and one way of these is seeking what really the truth is. Finally, teachers may highlight the difference between science and pseudoscience to avoid confusion for better learning. They can introduce the different products of science like biotechnology as can be applied in the field of agriculture and medicine to wash out the misconception regarding the different beliefs associated to pseudoscience.

(14) Output

Product	Literatures of pseudoscientific beliefs
Publication	IEC materials/flyers for pseudoscientific beliefs and its impacts
Patent	Copyright of pseudoscientific beliefs
People and Services	Proper orientation to enhance scientific literacy especially to the students. Helping the public to access the different products of science
Places and Linkages	Partnership with the teachers to emphasize the importance of evidence-based reasoning in science. Linkages with DOST to promote the use of different products of science and technology, and research.
