(9A) Abstract (This has a maximum of 250 words. It contains 1-2 sentences of rationale, followed by objectives, brief methodology, major findings, and implications of impact of the study.)

This study aimed to determine the self-efficacy and learning commitment of CAPSU athletes. This survey-correlational method research was conducted on forty-eight (48) out of fifty-two (52) athletes who represented the Capiz State University at the RSCUAA 6 at Bacolod, Negros Occidental. The data in this study were collected using a researcher-made questionnaire through Google Forms. The independent variables in the study were self-efficacy and while the dependent variable was the learning commitment of the athletes. The statistical tools used in the study were frequency count, percentage, mean, Analysis of Variance (ANOVA), and Pearson r. All inferential tests were set at 0.05 alpha level of significance. The findings of the study revealed that CAPSU athletes have a “high” level of self-efficacy and learning commitment, respectively. There was no significant difference in the learning commitment in terms of their demographic profile. Correspondingly, there was a high positive significant correlation among self-efficacy and learning commitment of the respondents.

(9B) Keywords (Write 3-6 words you used in the study, preferably not found in the title because words in the title are already given keywords. This would also include process, or methodology employed.)

Self-efficacy, learning commitment, athletes

(10) Introduction (This includes the rationale, background of the study, and objectives which are not divided by subheadings. Incorporate at least three (3) reviews)

Many different components have an impact on the athlete's performance. One of these is self-efficacy belief. Self-efficacy in sports involves a more complex structure than beliefs about performing different situational tasks and motor skills, such as hitting the ball hard or curved or hitting the opponent's court. Self-efficacy in sports is a combination of beliefs about ameliorative efficacy, collective efficacy, competitive efficacy, coping efficacy, learning efficacy, performance efficacy, preparatory efficacy, self-regulation efficacy, and motor skills efficacy. Self-efficacy in sports with these features emphasizes target setting, sportive learning, and individual and collective performance. Based on this information, it can be predicted that an athlete's self-efficacy includes general and special duties in the field of sports. Considering the evaluations made, an athlete's self-efficacy can be defined as the belief in individual abilities to successfully perform different performance tasks related to sport (Koçak & Güven, 2018).

According to Aras, et al., (2019), self-efficacy beliefs in sports affect the success level of the target behavior. Thus, athletes set targets according to their self-efficacy and determine the road maps they will follow. When they fall below their targets, they evaluate their performances with dissatisfaction. Whether this dissatisfaction is an incentive or deterrent to further efforts is also influenced to a certain extent by the athlete's self-efficacy and degree of inconsistency in achieving the goal. People with high self-efficacy beliefs increase their effort and determination in the face of negative discrepancies between their personal goals and achievements. At the same time, those who doubt themselves give up quickly.

Self-efficacy is classified as task-specific, domain-specific, and general self-efficacy. According to Bandura (1997), as cited by Kocak (2020), self-efficacy beliefs towards the field

	Document Type:	FORM ISO 9001:2015	Document Code	RES-F08
	Document Title: COMPLETED RESEARCH		Revision No.	00
			Effective Date	January 26, 2023
			Page	Page 3 of 17

or task directly affect behavior. The more customized the self-efficacy beliefs are to a certain field, the more successful the behavioral results in that domain can be. On the other hand, general self-efficacy is the state of psychological well-being of an individual and supports the task and the field self-efficacy. Sport has a unique structure that includes performing various tasks. Accordingly, the concept of athlete self-efficacy should be examined to explain sports' success and performance, which represent a dynamic sub-culture on college campuses due to varying needs and challenges within their community. Student-athletes, both male and female, are faced with the challenges of balancing academics, athletics, eligibility issues, and associated negative stereotypes, such as being "dumb jocks," entitled, academically lazy, or only interested in sports. Athletes also face the pressures of being in the spotlight, which includes negative criticism, particularly in their learning commitment. Other challenges include peer pressure and the high expectations of their teachers, coaches, and parents, specifically in their academic performance. Amid these rigorous athletic demands, student-athletes must make formidable decisions about their learning commitment, transition from college to the workplace, and adjust to life without competitive sports. Student-athletes must face the disappointment of not succeeding academically, though better than athletes (Jeitner, 2019).

Student-athletes engage in a holistic approach to their learning that provides traditional classroom instruction and valuable learning and development opportunities through the learning process. Traditional classroom instruction provides opportunities for learning that parallel the experiential learning derived from sports. On the other hand, teamwork allows for the exchange of knowledge and ideas that can prepare students for work after college. Also, teamwork facilitates professional development and encourages partnerships. Some perceived benefits of teamwork include a diverse pool of resources and knowledge and increased participation, with group work promoting self-confidence and allowing team members to engage in discussions that foster innovation. Another perceived benefit is strengthened interpersonal relationships, and in the university setting, group work promotes savings in time, resources, and equipment.

Recently, there has been a greater push to ensure all athletes meet university academic standards; thus, learning commitment is a great challenge to them. Gayles and Baker (2015) note that sports participation significantly demands student-athletes time and energy and limits opportunities for learning involvement beyond their athletic environment. This study aimed to determine the self-efficacy and learning commitment of CAPSU athletes. Specifically, it sought to determine the level of self-efficacy, the level of learning commitment of the respondents, and the difference in the self-efficacy of the respondents when grouped according to sex, age, year level, home location, sports, number of years as athletes, the difference in the learning commitment of the respondents when grouped according to sex, age, year level, home location, sports, number of years as athletes, and the relationship between self-efficacy and the learning commitment. This research is necessary because most of the previous literature focused on the capabilities of the athletes and self-efficacy and their learning commitment seems unexplored. There is a plethora of literature on the self-efficacy of athletes; therefore, this study shifts the focus to the self-efficacy that occurs through the learning commitment of the athletes. Self-efficacy helps students meet the changing needs of learning in a competitive world. In addition, this study shows that self-efficacy occurs through sports participation, and learning commitment is the only method to retain in the team.

	Document Type:	FORM ISO 9001:2015	Document Code	RES-F08

(11) Materials and Methods or Methodology (This includes the materials, methods, duration & location of the study. Materials and Methods are headings used in Natural Science researches and methodology is Social Sciences. Presentation of materials may not necessarily be in separate heading but may be incorporated in the specific methods used. Justify paragraphs with main headings in caps.)

This study used the survey-correlational method of research. This study was conducted at Capiz State University during the first semester of the AY 2022-2023. The respondents were 48 out of the 52 athletes of Capiz State University during the Regional State Universities and Colleges Athletics Association Region VI Regional Games 2023 randomly selected using the Cochran sample size formula.

The research instrument used in this study was a researcher-made questionnaire composed of three (3) parts:

Part 1 dealt with the socio-demographic profile of the respondents;

Part 2 dealt with the self-efficacy of the respondents; and,

Part 3 dealt with the learning commitment of the respondents.

The self-efficacy questionnaire comprised thirty (30) items with four (4) categories: competitive efficacy, performance efficacy, self-regulatory efficacy, and motor skills efficacy. The learning commitment questionnaire comprised thirty (30) items with three (3) categories: achievement and motivation, learning engagement, and homework.

The survey questionnaire underwent face and content validation, and a pilot test was conducted on 30 CAPSU-Mambusao Satellite College athletes. The result of the Cronbach alpha showed a reliability index of .967 on self-efficacy while the Cronbach alpha showed a reliability index of .955 on learning commitment. On the other hand, the computer process factor analysis results showed that all the items of the self-efficacy and learning commitment questionnaires were included.

In collecting the data, the researchers administered the survey through a Google form. Accomplished questionnaires through Gmail accounts were automatically collected. The data was analyzed and interpreted using the appropriate scoring scale and verbal interpretation. The following response categories with corresponding scores were employed in this study: Strongly Agree (5), Agree (4), Uncertain (3), Disagree (2), and Strongly Disagree (1). The following verbal interpretation with scoring intervals was employed in this study: Very High (4.20-5.00), High (3.40-4.19), Moderately High (2.60-3.39), Low (1.80-2.59), and Very Low (1.00-1.79). The collected data from the investigation was analyzed and interpreted using the Statistical Package for Social Science (SPSS) software. Frequency counts and Percentages were used to determine the number of observations in each category and its corresponding percentage. Mean was used to determine the level of self-efficacy and the level of learning commitment of the respondents. Analysis of Variance (ANOVA) was used to determine the significant differences in the self-efficacy among the respondents' learning commitment levels. Pearson measured the relationship between the respondents' self-efficacy and learning commitment. All inferential tests were set at a .05 alpha level of significance.

(12) Results and Discussions (This part contains presentation of results (data) with reference to the table and figure, to be followed by discussion, with support of reviewed literature. Sequence shall be based on the objectives of the study. Tables are formatted without the vertical lines. Horizontal lines are set at the top and bottom portions as well as below table headings and above major subdivisions. Justify paragraphs with main headings in caps.)

LEVEL OF SELF-EFFICACY OF THE ATHLETES

The result on the levels of self-efficacy of respondents is shown in Table 1. Data reveal

	Document Type:	FORM ISO 9001:2015	Document Code	RES-F08
	Document Title: COMPLETED RESEARCH		Revision No.	00
			Effective Date	January 26, 2023
			Page	Page 5 of 17

that in the entirety, CAPSU athletes have a high level of self-efficacy ($M = 3.75$). CAPSU Athletes have a high level of competitive efficacy ($M=3.87$), motor skills efficacy ($M=3.64$), performance efficacy ($M=3.64$), and self-regulation efficacy ($M=3.83$). This implies that the respondents believe they could have a certain physical ability, set goals, and were motivated to participate in their respective sports with a competitive drive to win. They were drawn to the training, focus, and discipline to improve their respective sports' physical and technical skills. Thus, at one extreme is the belief that winning is important and the only thing in competition, as it builds confidence and builds esprit de corps, cohesion, and team spirit. Because various body parts are trained harmoniously, physical development and mental health are positively affected by relieving stress and increasing confidence. Sports climbing has several positive aspects, including strengthening body muscles, improving endurance, and overcoming mental limitations through high-intensity physical activity. In particular, sports climbing requires techniques to distribute body weight and conserve strength by using all body parts when climbing, as well as endurance to continue climbing. Besides advanced physical training that utilizes all body parts, sports participants can improve creativity by finding and performing various sets to develop motor skills. It is a comprehensive sport that can improve abilities such as quickness and mental strength to find a different way in an instant when encountering difficulties. However, it also contains relatively difficult elements compared to other leisure activities, such as risk factors due to the precarious nature of sports and the physical strength and practice required to reach a certain level of skills. The findings support the idea of Mills, et al. (2020) that athletes with high self-efficacy in competition tend to use more motivational imagery than their low self-efficacy counterparts. No such differences were found for cognitive imagery use in competition or for the use of either motivational or cognitive imagery in practice.

LEVEL OF LEARNING COMMITMENT OF THE ATHLETES

The result on the levels of learning commitment of respondents is shown in Table 2. Data reveal that in the entirety, CapSU athletes have a high level of learning commitment ($M = 3.86$). CapSU Athletes have a high level of activation and motivation ($M=3.96$), learning engagement ($M=3.86$), and homework ($M=3.77$).

The high learning commitment of the athletes implies that many athletes' personal goals and aspirations, such as winning championships, breaking records, or reaching personal bests, require constant learning and improvement. High learning commitment is often associated with resilience and grit, traits that enable athletes to persist through challenges and setbacks. They have access to excellent coaching, training facilities, and educational resources that support their learning and development.

The result is comparable Camiré,(2021), It is not surprising that the coaches over-emphasized life skills as a representative of personal development, given that most research conducted on development through sport focuses on athletes' development of life skills The current study revealed that the coaches had difficulty articulating the concept of personal development and how they help support and facilitate athletes' personal development through sport. Previous studies examining personal development have used academic progress and/or classroom success as a measure, but these lack legitimacies in their correlation with personal development (Barna & Brott, 2014). However, Personal development is not synonymous with life skills and/or academic development (Gould et al., 2016). Lack of research and dialogue within sports communities about athletes' personal development through sport may contribute to coaches' inability to conceptualize personal development.

	Document Type:	FORM ISO 9001:2015	Document Code	RES-F08

			Page	Page 6 of 17

DIFFERENCE IN THE SELF-EFFICACY WHEN GROUPED ACCORDING TO THE SEX, AGE, YEAR LEVEL, HOME LOCATION, SPORTS, AND NUMBER OF YEARS AS ATHLETES OF THE RESPONDENTS

The difference in self-efficacy when grouped according to sex, age, year level, home location, sports, and number of years as athletes of the respondents are shown in Table 3a and Table 3b. Generally, there is no significant difference in self-efficacy of the respondents when grouped according to sex, $t(46) = -.979$, $p = .333 > .05$ alpha level of significance, despite female respondents ($M=3.90$) attaining higher mean scores than male respondents ($M=3.58$). Moreover, there is no significant difference in the self-efficacy of the respondents when grouped according to home location, $t(46) = 1.101$, $p = .277 > .05$ alpha level of significance, despite respondents residing in the rural areas ($M=3.88$) attaining higher mean scores than respondents residing in urban areas ($M=3.51$).

Generally, there is no significant difference in self-efficacy when grouped according to age, $F(2,45) = 1.454$, $p=.244 > .05$ alpha level of significance; self-efficacy when grouped according to sports, $F(4,43) = .393$, $p=.813 > .05$ alpha level of significance, self-efficacy when grouped according to number of years as athletes, $F(3,44) = .927$, $p=.436 > .05$ alpha level of significance; however, there is a significant difference of self-efficacy when grouped according to year level, $F(3,44) = 3.535$, $p=.022 < .05$ alpha level of significance.

The result implies that sex, home location, age, sports, and number of years do not significantly differ on athlete's self-efficacy, implying that they experience similar psychological processes. The access to quality coaching and mentorship is increasingly standardized, providing similar levels of psychological support and skill development regardless of their background. The training programs of the university equally address the development of self-efficacy regardless of the demographic or the sport they play. However, year level significantly differs in the self-efficacy of the athlete implying that as they advance in their course year level, they acquire more knowledge and skills both academically and athletically. This increases competence and boosts their confidence in their abilities, enhancing their self-efficacy.

The result is comparable to Tan & Shao, (2021) that boys and girls have similar self-efficacy in adolescent sports health. Adolescents' self-efficacy of sports health has significant differences among different sports items, where the basketball group scored the highest. Adolescents at the professional level have the highest self-efficacy in sports health, whereas the skillful level and beginner level have no significant difference. The male students are more enthusiastic and fonder of sports than female students. There are significant differences between sports commitment and sports health of adolescents in different sports, where the basketball group scored the highest.

DIFFERENCE IN THE LEARNING COMMITMENT WHEN GROUPED ACCORDING TO THE SEX, AGE, YEAR LEVEL, HOME LOCATION, SPORTS, AND NUMBER OF YEARS AS ATHLETES OF THE RESPONDENTS

The difference in the learning commitment when grouped according to sex, age, year level, home location, sports, and number of years as athletes of the respondents are shown in Table 4a and Table 4b. Generally, there is no significant difference in the learning commitment of the respondents when grouped according to sex, $t(46) = -.778$, $p = .440 > .05$ alpha level of significance, despite female respondents ($M=3.73$) attaining higher mean scores than male respondents ($M=3.99$). Moreover, there is no significant difference in the learning commitment of the respondents when grouped according to home location, $t(46) = 1.511$, $p = .138 > .05$ alpha level of significance, despite respondents residing in the rural

	Document Type:	FORM ISO 9001:2015	Document Code	RES-F08
	Document Title: COMPLETED RESEARCH		Revision No.	00
			Effective Date	January 26, 2023
			Page	Page 7 of 17

areas ($M=3.88$) attaining higher mean scores than respondents residing in urban areas ($M=3.51$).

Generally, there is no significant difference in the learning commitment when grouped according to age, $F(2,45) = 874$, $p=.424 > .05$ alpha level of significance; learning commitment when grouped according to year level, $F(3,44) = 2.603$, $p=.064 > .05$ alpha level of significance; learning commitment when grouped according to sports, $F(3,43) = .172$, $p=.951 > .05$ alpha level of significance; learning commitment when grouped according to number of years as athletes, $F(3,44) = 1.144$, $p=.342 < .05$ alpha level of significance.

The result implies that sex, home location, age, year level, sports, and number of years are not significantly differs in athletes learning commitment implies that many athletes, regardless of their demographic characteristics, are deeply passionate about their sport and have access to similar training resources, facilities, and coaching expertise, promoting consistent learning commitment. This passion drives a consistent commitment to learning and improvement. They often have a strong personal drive to excel, which fosters a uniform commitment to learning regardless of age, sex, or other factors.

RELATIONSHIP AMONG THE SELF-EFFICACY AND LEARNING COMMITMENT

Table 5 reveals a high positive significant correlation between self-efficacy and learning commitment of the respondents, $r=.954^{**}$, $p=.000 < .05$ alpha level of significance.

This further shows that if the self-efficacy of the athletes increases, their learning commitment increases, and vice versa. The result implies that self-efficacy is related to the learning commitment of the athletes. In other words, self-efficacy and the learning environment should not be treated separately but must be considered cohesively for the realization and betterment of the performance of the athletes. The result of the study is comparable to Mokoena, B. A., & Dhurup, M. (2019) in which transformative coaching methods were highlighted, which add to the body of sports management research by highlighting how coaches influence the self-efficacy beliefs of their athletes. Specifically, transformative coaches utilize verbal/social persuasion methods including overt expressions of belief in and confidence in the athlete's potential, high expectations, relentless pushing, positivity, encouragement, motivation, trust, and personalized communication/feedback. Practitioners can utilize the data and experiences of athletes in this study to cultivate stronger coach-athlete relationships that foster self-efficacy development. More than two-thirds of the athletes expressed having transformative coaches, while approximately one-third reported experiences with destructive coaches who utilized overtly abusive tactics. The result is comparable to Tan & Shao, 2021) that exercise induces a higher score of sports commitment; however, no significant difference is observed for the skillful level and the beginner level. A significant positive correlation is found between sports health and self-efficacy and sports commitment, self-efficacy, and sports commitment. Besides, self-efficacy is a partial intermediary between sports health and sports commitment.

(13) Conclusions and Recommendations (This part shall be written in narrative form and arranged based on the objectives and findings. Conclusions are general statements answering the objectives. Recommendations are based on the conclusions. They may be split or combined based on their length, which means, conclusions and recommendations may be split under separate headings if they are long. Justify paragraphs with main headings incaps.)

CONCLUSION

1. High self-efficacy athletes exhibit powerful traits. Their high level of self-efficacy

	Document Type:	FORM ISO 9001:2015	Document Code	RES-F08
			Revision No.	00
	Document Title:	COMPLETED RESEARCH	Effective Date	January 26, 2023
			Page	Page 8 of 17

frequently indicates the determination and capacity for sports success.

2. Athletes that have a high level of learning commitment demonstrate their involvement in the process of learning, which is a blend of values and abilities that includes a drive to succeed not only in sports but also academically, a continuous sense of the worth of learning, and self-belief.
4. When athletes are categorized based on their self-efficacy levels, there are notable differences in their dedication to learning. Self-efficacy frequently affects the selection of tasks and persistence.
5. Based on the athlete's positive and significant link with their learning commitment, it can be concluded that their self-efficacy contributes to their exceptional performance through effort and perseverance.

RECOMMENDATIONS

1. To increase athletes' self-efficacy, coaches and trainers can use exposure, friendship games, and mastery experiences, providing them with honest criticism and guiding athletes through training.
2. To build a sense of obligation for their studies and training, CAPSU athletes must complete their coursework and attend classes.
3. Athletes may engage in activities that may lead to goal attainment such as being attentive to instruction, diligently employing the comprehension strategy to the lessons are remembered and sustain their efforts in their studies to be successful.
4. Deans and Program Chairs may allow athletes to attend sports clinic where they are able to participate.
5. Athletes may prioritize their tasks, maintain motivation, and be dedicated to their studies and sports training.
6. Coaches and Trainers may constantly challenge, praise, and encourage their athletes, in terms of their education, athletes can practice safe, ethical, and responsible technology they may work with other students and reflect on their learning, making changes as they go along.

(14) Output (Indicate the specific products, processes or services which the project has produced; quantify when possible.)

Designing a training model that enhances self-efficacy and learning commitment among athletes involves integrating various elements that target psychological, technical, and social aspects. This training design model aims to enhance self-efficacy and learning commitment among athletes is crucial for several reasons. This model not only improves performance but also fosters long-term development, well-being, and success in sports. By focusing on progressive skill development, athletes can improve their technical abilities, leading to better performance in competitions. A structured approach ensures continuous learning and improvement, preventing burnout and plateauing. Mental skills development enhances athletes' ability to cope with stress and injuries, promoting mental toughness. A focus on self-efficacy helps athletes develop a growth mindset, viewing challenges as opportunities for growth. A well-rounded training program addresses both physical and mental aspects, fostering strong relationships among teammates, and reducing injury risks. Regular evaluations and feedback ensure training remains relevant and effective, fostering responsibility and commitment. Sustainable training practices can extend an athlete's career and prepare them for successful transitions into post-sport careers.

	Document Type:	Document Code	RES-F08

Training Design Model for Enhancing Self-Efficacy and Learning Commitment of Athletes

Goal

The goals of the training process are as follows:

1. To enhance athletes' proficiency in sport-specific skills, self-perception, confidence, performance under pressure, and set personalized performance milestones.
2. To foster a culture of continuous improvement, lifelong learning, and leadership skills among athletes through high engagement and attendance.

Strategy:

Assessment:

Conduct baseline assessments of athletes' self-efficacy and learning commitment through surveys, and performance evaluations.

Skill Development and Mastery

Implement a tiered training program that progressively increases in difficulty. Begin with basic skills and gradually introduce more complex techniques. Emphasize repetitive practice and drills to reinforce skill mastery and build muscle memory.

Performance Feedback and Reflection

Provide consistent, constructive feedback focusing on both strengths and areas for improvement. Use video analysis and one-on-one sessions for detailed feedback. Encourage athletes to engage in self-reflection through journals or discussion sessions where they analyze their performances and identify learning points.

Mental Skills Training

Use mental imagery and visualization to practice skills and scenarios, enhancing confidence and preparedness.

Incorporate techniques such as deep breathing, meditation, and mindfulness to help athletes manage stress and maintain focus.

Supportive Environment

Foster a supportive team culture where athletes encourage and learn from each other. Use team-building activities to strengthen bonds and create a positive atmosphere. Pair younger or less experienced athletes with seasoned mentors who can provide guidance, support, and encouragement.

Adaptive Learning and Flexibility

Create flexible training plans that can be adjusted based on the athlete's progress, needs, and feedback. The use of technology such as wearables, apps, and virtual coaching to provide personalized training insights and facilitate remote learning.

Challenge and Achievement

Design training sessions that include incremental challenges to push athletes slightly beyond their comfort zones, fostering growth and resilience. Acknowledge and reward progress and achievements, both big and small, to boost morale and reinforce commitment.

Continuous Education

Offer regular workshops and seminars on various topics, including nutrition, sports psychology, injury prevention, and advanced techniques. Encourage a culture of lifelong learning where athletes are motivated to continually seek knowledge and improvement.

Evaluation and Adaptation

Conduct regular evaluations of the training program's effectiveness through performance metrics, self-efficacy surveys, and learning commitment assessments.
