(8) Discipline/Field of Specialization

INFORMATION TECHNOLOGY

(9A) Abstract

Database management systems (DBMSs) are specially designed applications that interact with the user, other applications, and the database itself to capture and analyze data. The essential feature of database technology is that it provides an internal representation (model) of the external world of interest.

The study generally aimed to design a database of Herbal and Folkloric Medicine. It aimed to develop a functional and useful database, provide a data bank that will give full description of the kinds of medicinal plants and traditional medicine health practices, evaluate the developed software in terms of efficiency and reliability and promote simplified and standardized information demographic for specific herbal, folkloric medicine and commodities designed to keeping data files, and determine the level of acceptability of the system using ISO-9126-1 quality system.

The researchers focused to design a Databank of Medicinal Plants Used by Traditional Healers in the Municipality of Pilar. The researchers then conducted personal interview in order to understand the background of the study and to give complete information. The databank is successfully designed and ready for utilization in an online and mobile platform. This will allow the users an easier access in looking up for appropriate herbal medicines to consume most especially during calamities when no accessible roads for rural health centers and hospitals are available.

(9B) Keywords: Python Framework: Django Database: Postgress, Database Management Systems, Therapeutic, Data Bank, Traditional Healers

(10) Introduction

Currently, the world depends on technology and everyone from the young to the old seemed to be deeply involved. Technology has become one of the most important elements in today's societies and its role in our lives keeps getting complex. It is true that it has impacted all sectors of the society and even helped to increase efficiency and effectiveness. The integration of technological innovations into different facets of our lives has indeed helped to transform the world and to improve efficiency in almost everything we do. Today new innovations become obsolete fast. People have become increasingly competitive and every year, new ideas and technologies are released. With the advancement of technology now, huge data are being collected but because of the fast-paced technology, proper documentation is being neglected that should have been a great help in producing helpful information.

Database management systems (DBMSs) are specially designed applications that interact with the user, other applications, and the database itself to capture and analyze data. The essential feature of database technology is that it provides an internal representation (model) of the external world of interest. Well-known DBMSs include MySQL, PostgreSQL, SQLite, Microsoft SQL Server, Microsoft Access, Oracle, Sybase, dBASE, FoxPro, and IBM DB2. Efficient data management typically requires the use of a computer database. The DBMS serves as the intermediary between the user and the database. The database structure itself is stored as a collection of files, and the only way to access the data in those files is through the DBMS. The DBMS presents the end user (or application program) with a single, integrated view of the data in the database. Having a DBMS between the end user's applications and the database offers some important advantages. Mainly the DBMS enables the data in the database to be shared among multiple applications or users. Also, the DBMS integrates the many different users' views of the data into a single all-encompassing data repository. A DBMS provides advantages such as: 1.Improving data security. The more users access the data, the greater the risks of data security breaches. Corporations invest considerable amounts of time, effort, and money to ensure that corporate data are used properly. A DBMS provides a framework for better enforcement of data privacy and security policies. 2. Improved data sharing. The DBMS helps create an environment in which end users have better access to more and better-managed data. Such access makes it possible for end users to respond quickly to changes in their environment. 3. Minimized data inconsistency. Data inconsistency exists when different versions of the same data appear in different places.

			Page	Page 3 of 16

The study generally aimed to design a database of herbal and folkloric medicine. Specifically, the study has the following objectives:

1. Develop a functional database for herbal and folkloric medicines;
2. Provide a data bank that will give full description of the kinds of medicinal plants;
3. Evaluate the developed software in terms of efficiency and reliability and promote simplified and standardized information demographic for specific herbal and Folkloric medicine
4. Determine the level of acceptability of the system using ISO/IEC-9126-1 quality system.

Maningas et al. (2000) emphasised that having information in the hands of farmers meant giving them control over their resources and decision-making processes, which in turn meant they were empowered. Food and agriculture organizations point out that providing a reliable and effective system for the delivery of essential information and technological services facilitates the clients' crucial role in decision-making towards improved agricultural production, processing, trading, and marketing. They also point out that improving access to data is crucial for rural development because increasing agricultural productivity will be a key factor in improving the income of farming communities. Sustainable agricultural development depends more on the people using the inputs than it does on the actual inputs.

Stuart et al. (2003). The albularyo, who is competent in most folkloric modalities and is typically particularly skilled in the use of medicinal plants, may be referred to as the "general practitioner" in the hierarchy of healers and experts in Philippine folk medicine. Both the manghihiilot and the magpapaanak are referred to by the term hilot. The manghihiilot is an expert in methods and therapies for musculoskeletal problems, fractures, and sprains. In addition to making prenatal visits and giving birth, the magpapaanak frequently performs the suob rite. Some healers only use more specific modalities when using folklore remedies. The mangluluop specializes in diagnostic methods and typically refers patients to the albularyo, medico, or manghihiilot for conclusive therapies after a diagnosis. The medico is an additional specialization that combines ancient folklore practices with elements of western medicine.

Dapar, M.L. et al. (2020). The Manobo tribe in Agusan del Sur, the Philippines, is known for its ethnopharmacological traditions and culturally rich knowledge of medicine. The study's findings showed that the Agusan Manobo used a wide variety of medicinal plants, with 122 species being used in 16 different categories. Due to potential migration, acculturation, and the younger generation's waning interest as a result of the expanding availability of commercial over-the-counter medication, traditional knowledge may be lost or forgotten, just like the knowledge of any other ethnolinguistic indigenous group in the nation. Few people, primarily their healers, elders, and tribal leaders, are aware of their therapeutic herbs. The Agusan Manobo use medicinal plants, and this quantitative ethnopharmacological record offers molecular validation of their species of uncertainly identified medicinal plant and demonstrates for the first time the high consensus and relative value of these plants. Combining quantitative ethnopharmacological documentation with species confirmation of medicinal plants used in traditional medicine using an integrative molecular approach is a breakthrough for getting more in-depth and thorough discoveries that will be a beneficial addition to the body of knowledge. The results of this investigation will be used as a source of information for upcoming biochemical, pharmacological, and systematic studies.

(11) Materials and Methods or Methodology

Planning

The researchers focused to design a Databank of Medicinal Plants Used by Traditional Healers in the Municipality of Pilar, and to test the accuracy of the developed system.

Methods

The researchers conducted personal interview in order to understand the background of the study and to provide complete information. The researchers gave their best to apprehend the gathered data.

Procedures

1. In gathering the information, the researchers followed the instruction method. Through this method, the researchers gained knowledge on how to start and develop the system.

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 4 of 16

2. The researchers used this method in order for them to have a basis and guide to start developing the proposed system.
3. The researchers decided to use the Python Framework: Django Database: Postgress as a programming language to develop the entire system.
4. Additionally, the researchers accurately examined and devised the coding for their system in order to ensure its functionality and efficiency.

Software Design

Software requirements were essentials in the making of the study program. Programming Language: Python Framework: Django Database: Postgress was used to build the database. This serves as the record management where all the data from the transaction is saved and safely kept.

Time Schedule

This study was conducted from March 2018 to March 2022 by the researchers.

Technical Specification

This project was composed of software/hardware and peopleware for recommendations. The required technology for this system are the following: Personal Computer (PC)/ or laptop with installed Microsoft Access with 2007 version, 2GB (RAM) or above, 800MB disk space or higher and 64 bit Operating System (OS): Intel ® Core™ i7-8550U Processor, up to 4.0GHz, 1366x768 screen resolution, keyboard and mouse for inputting data and a printer to produce the output.

Table 1. Results of Pilot Testing

PILOT TESTING

Table 1 shows that the system was evaluated by the 20 faculty members of CapSU Pilar through pilot testing. In functionality, the system's rate had a mean of 5.00 as to sustainability and had a mean of 4.67 as to accuracy, interoperability, compliance, and security, and with an average mean of 4.80 rated as "Very Acceptable".

In reliability, the system's rate had a mean of 4.67 as to maturity and fault tolerance, and 5.00 as to recoverability, and with an average mean of 4.78 rated as "Very Acceptable."

In usability, the sytem's rate had a mean of 5.00 as to understandability, learnability, and operability, and as to attractiveness, it had a mean of 4.67 with an average mean of 4.92 rated as "Very Acceptable."

In efficiency, the system's rate had a mean of 4.67 and 4.50 as to time behavior and resource utilization, respectively. It had an average mean of 4.83 rated as "Very Acceptable."

In maintainability, the system's rate had a mean of 4.67 as to analyzability and changeability, and a mean of 5.00 as to stability and testability. The system had an average mean of 4.83 rated as "Very Acceptable".

In portability, the system's rate had a mean of 4.67 as to adaptability and 5.00 as to installability, conformance, and replaceability, with an average mean of 4.92 rated as "Very Acceptable".

Table 2. Results of Final Testing

FINAL TESTING

Table 2 shows that the system was evaluated by the 5 IT experts using ISO/IEC-9126-1 quality system for software development.

In functionality, the system's rate had a mean of 4.73 as to sustainability and security, 4.69 as to accuracy, 4.58 as to interoperability, and 4.65 as to compliance. Overall, it had a mean of 4.68 rated as "Very Acceptable."

In reliability, the system's rate had a mean of 4.62, 4.65, and 4.85 as to maturity, fault tolerance, recoverability, respectively, with an average mean of 4.85 rated as "Very Acceptable".

In usability, the system's rate had a mean of 4.81 as to understandability and learnability, 4.73 as to operability and 4.69 as to attractiveness. It had an average mean of 4.85 rated as "Very Acceptable."

In efficiency, the system's rate had a mean of 4.65 and 4.73 as to time behavior and resource utilization, respectively, with an average mean of 4.85 rated as "Very Acceptable."

In maintainability, the system's rate had a mean of 4.65 as to analyzability, 4.81 as to changeability, 4.73 as to stability, and 4.69 as to testability. It had an average mean of 4.85 rated as "Very Acceptable".

In portability, the system's rate had a mean of 4.77 as to adaptability, 4.81 as to installability and replaceability, and 4.73 as to conformance. Overall, it had a mean of 4.19 rated as "Very Acceptable."

OVERALL RATING IN FINAL TESTING

CHARACTERISTICS	MEAN	DESCRIPTIVE RATING
Functionality	4.68	Very Acceptable
Reliability	4.85	Very Acceptable
Usability	4.85	Very Acceptable
Efficiency	4.85	Very Acceptable
Maintainability	4.85	Very Acceptable
Portability	4.19	Very Acceptable
Grand Mean	4.71	Very Acceptable

Table 3. Overall Rating in Final Testing

Based on the table, the system was rated as "Very Acceptable" with a mean of 4.71 in its overall performance. The results had proven that the databank for medicinal plants has been successfully developed.

(13) Conclusions and Recommendations

Conclusions

The researchers were able to develop an accessible and functional database for herbal and folkloric medicine. Full descriptions of the kinds of medicinal plants were provided in the databank. Moreover, the system was deemed efficient and reliable as per the evaluation of IT experts. Lastly, it was rated "Very Acceptable" using ISO/IEC-9126-1 quality system.

Recommendations

The cultivation of therapeutic plants and their preservation should be encouraged by the government. Measures should be conducted to make these plants well-known. The LGU should make more of an effort to raise public knowledge of the importance of medicinal plants.

(14) Output

The researchers were able to develop a databank as a repository of medicinal plants.

NAME	FAMILY	DESCRIPTION	
Maria Clara	Lecythidaceae	Description	+
Botong	Lecythidaceae	Botong is a tree growing to a height of 8 to 15 meters. Leaves are large, obovate or obovate-oblong, 20 to 40 centimeters long, entire, thick, shining, stalkless, blunt-tipped, and pointed at the base. Flowers are very large and white, borne in short, erect, few-flavored racemes. Calyx-tube is about 1 centimeter long; the lobes, 2 or 3, are oblong-ovate, concave, green and about 2.5 centimeter long. Petals are deciduous, four, thin, first white and then brownish, oblong, 7 to 8 centimeters long, and 3 to 4 centimeters wide. Stamens are very numerous, slender and united at the base, 10 to 12 centimeters long, white below, and shading to purple above. Anthers are small and yellow. Fruit has a typical tetragonal lantern shape, 8 to 14 centimeters long and 8 to 12 centimeters thick, containing one large seed.	+
Abiu	Sapotaceae		+
Abang-abang	Vitaceae		+
Abaniko	Iridaceae	Iris domestica belongs to the family Iridaceae, which comprises about 60 genera and 800 species worldwide.	+

Details

Abiu

Description:

Botany: Abiu is an evergreen tree with a dense crown that grows to a height of 6 to 24 meters in favorable conditions, as high as 35 meters. Leaves are elliptic to oblong, varying in size from 10 to 20 centimeters in length, 3.5 to 6.5 centimeters in width. Fruits vary in shape, from spherical to oval; vivid yellow when ripe, containing one to four ovate seeds. Seeds are covered by a thin layer of pulp. Flesh of the fruit is translucent, with a creamy or custard-like texture, with a flavor hinting of rambutan. Not fully ripe fruits yield a latex that stick to lips. Flowers are hermaphroditic, arising singly or in clusters from leaf axils, borne by slender, elongated shoots. Petals are small, four to five, cylindrical, white to greenish in color. Flowers blossom in the morning and staying open for about two days.

Distribution: - Recently introduced. - Widely distributed throughout Latin America.

Constituents: - Nutrition analysis per 100 g of edible portion yielded: energy 140 cal (588 kJ), protein 1.8 g, fat 0.4 g, carbohydrate 36.3 g, fiber 0.9 g, ash 0.9 g, calcium 22 mg, iron 1 mg, niacin 34 mg, phosphorus 41 mg, riboflavin 0.02 mg, thiamin 0.02 mg, niacin 3.4 mg, vitamin C 43 mg, vitamin A 130 mg, lysine 316 mg, methionine 178 mg, threonine 219 mg, tryptophan 57 mg, (7) - Oil components of fruit yielded α -copaene (27.7%) as dominant component, with hexadecy acetate (19.0%) and palmitic acid (12.4%). (7) - Bark extract yielded taraxerol and β -sitosterol. (7) - Benzoid extract of fruit revealed the presence of lupeol, α -amyrin, erythrodil and the rare tetracyclic triterpene Dammarendiol II. (5)

Properties: - Latex hardens on exposure to air. - Considered antidiarrheal, febrifuge, anti-inflammatory. - Studies suggest antioxidant and antidiabetic properties.

Uses: - The fruit has limited commercial value as it is commonly damaged by small insects (bichos in Spanish and Portuguese). In Brazil, the chief pests are fruit flies. (Fruits are picked while underripe and firm for transport in markets.) (8) - In Columbia, people who eat the fruit raw and out of hand are advised to grease their lips to prevent the gummy latex from sticking to them. (8) - Fruit used in ice cream, sherbets, and fruit salads.

Others: - Wood: Wood is durable and straight-grained; used for construction.

Dashboard - Summary of Existing Plants

The screenshot shows the 'Herbal Philippines' dashboard with a green header. It includes a navigation bar with 'Dashboard' and 'Plants' tabs. Below, a section titled 'Latest Plants (Nov. 10, 2022)' displays a table of plant records. Each record includes a name, family, description, and a blue circular icon with a plus sign.

NAME	FAMILY	DESCRIPTION
Maria Clara	Lecythidaceae	Description
Botong	Lecythidaceae	Botong is a tree growing to a height of 8 to 15 meters. Leaves are large, obovate or obovate-oblong, 20 to 40 centimeters long, entire, thick, shining, stalkless, blunt-tipped, and pointed at the base. Flowers are very large and white, borne in short, erect, few-flavored racemes. Calyx-tube is about 1 centimeter long; the lobes, 2 or 3, are oblong-ovate, concave, green and about 2.5 centimeter long. Petals are deciduous, four, thin, first white and then brownish, oblong, 7 to 8 centimeters long, and 3 to 4 centimeters wide. Stamens are very numerous, slender and united at the base, 10 to 12 centimeters long, white below, and shading to purple above. Anthers are small and yellow. Fruit has a typical tetragonal lantern shape, 8 to 14 centimeters long and 8 to 12 centimeters thick, containing one large seed.
Abiu	Sapotaceae	
Abang-abang	Vitaceae	
Abaniko	Iridaceae	Iris domestica belongs to the family Iridaceae, which comprises about 60 genera and 800 species worldwide.

(17) Acknowledgments

The creation of this databank is never a cloistered endeavor. The researchers would like to express their sincerest gratitude to Sir Mark Jun A. Gersaniva, a Software Engineer, who unselfishly extended his time in helping them design and test the system. They would also like to acknowledge the IT experts for sharing their expertise in evaluating the said system. Also, commendation is given to the faculty members of CapSU Pilar for taking part in the pilot testing. Lastly, the researchers would like to thank the CapSU Pilar community under the supervision of Ma'am Jennifer P. Benliro, Satellite College Director for their invaluable advice and suggestions for the improvement of this piece of endeavor.
