(9A) Abstract (This has a maximum of 250 words. It contains 1-2 sentences of rationale, followed by objectives, brief methodology, major findings, and implications of impact of the study.) Balancing faculty instructional workload with other functions in school would encourage more faculty to engage in research. Faculty of HEIS are encouraged to conduct researches aside from performing instructional functions. Thus, this study ascertains if instructional workload has something to do with research engagement of CapSU Pilar faculty members as to strengthen both instruction and research functions. This study involved a population of 30 permanent CapSU Pilar faculty members. A researcher-made questionnaire was used in collecting data. Class loads covering three academic years (6 semesters, excluding summers) were included in the instructional workload. The descriptive statistics used in the study were frequency count, percentage, mean and standard deviation. The inferential statistics used were: t-test for independent samples, one-way analysis of variance (ANOVA), and the Pearson r. The alpha level of significance was set at 0.05. Results revealed that the faculty are "highly loaded." On the other hand, the faculty members' research engagement resulted to "high" level. There is no significant difference found on the level of instructional workload when it comes to sex. On the contrary, a significant difference was ascertained on the level of instructional workload when classified according to age, civil status, educational attainment, position, number of years in service and family monthly income. The level of research engagement does not differ significantly when classified as to sex. However, it resulted significant difference in the respondents' age, civil status, educational attainment, position, number of years in service and family monthly income. Moreover, findings revealed significant relationship between faculty members' instructional workload and research engagement. (9B) Keywords (Write 3-6 words you used in the study, preferably not found in the title because words in the title are already given keywords. This would also include process, or methodology employed.) Instructional Workload, Research Engagement, Faculty				
(10) Introduction (This includes the rationale, background of the study, and objectives which are not divided by subheadings. Incorporate at least three (3) reviews) The role of the faculty for the provision of quality instruction is of foremost importance. Thus, it is important that the workload of faculty should be looked into in order for them to become more effective and efficient in performing the tasks assigned to them. It is for this reason that CHED has guidelines on faculty class loading which should be followed by all HEIs not only for the sake of compliance but also to ensure quality service. Lucas (2015) mentioned that

			Effective Date	
			Page	Page 3 of 10

work overload leads for faculty to be less productive. Strengthening instructional workload would bring about quality instruction and other areas like research, extension programs and community outreach services and other core and support functions of the faculty. Aside from strengthening the instruction function of university, research equally plays a very pivotal function for the development of the university. It is for this reason that faculty and staff are strongly encouraged to engage in research. Calmorin and Calmorin as cited by Mahilum (2010) emphasized that research has deep seated psychological aspects. It stimulates and challenges man to remove the threat of stagnation. It guides him in his efforts to obtain good results that contribute to his satisfaction and self-fulfillment. Calmorin (2000) advances the principle that research oriented teachers are progressive ones. The importance of educational researches is highly recognized for its positive bearing on the improvement of quality instruction, student achievement, and teaching strategies. Research findings are utilized as a basis towards improved instructional practices and areas of concerns for community services. However, due to heavy instructional workload, many faculty members are deprived of time to engage in research. Balancing faculty instructional workload with other functions in school would encourage more faculty to engage in research. King (2007) mentions that faculty would be motivated to be involved in other functions in school like conducting researches if they have equitable teaching load. Hence, this study tries to ascertain if instructional workload has something to do with research engagement of CapSU Pilar faculty members as to strengthen both instruction and research functions. Moreover, this study was conducted to determine the level of instructional workload; the level of research engagement; if there is significant difference on the level of instructional workload when classified as to sex, age, civil status, position, educational attainment, number of years in service and monthly salary; if there is significant difference on the level of research engagement when classified as to sex, age, civil status, position, educational attainment, number of years in service and monthly salary; and if is there significant relationship between instructional workload and research engagement of faculty.

(11) Materials and Methods or Methodology (This includes the materials, methods, duration & location of the study. Materials and Methods are headings used in Natural Science researches and methodology is Social Sciences. Presentation of materials may not necessarily be in separate heading but may be incorporated in the specific methods used. Justify paragraphs with main headings in caps.)

Descriptive-correlational method of research was used in this study. It was conducted to a population 30 permanent faculty members of CapSU Pilar during the A.Y. 2018-2019. Data were gathered using a researcher-made questionnaire composed of two parts. Part I called for the personal profile and part two comprised of a 49-item questionnaire on research engagement. The survey instrument was subjected to face and content validation of the panel members, before it was pilot tested. The result of the pilot testing was then subjected to reliability test done by the statistician. It got a reliability index of .851 which is highly reliable. The instructional workload was categorized as follows: above 21 units - heavily loaded, 16-21 units - rightly loaded and below 15 units - lightly loaded. In research engagement, he questionnaire was answered in a 5-point Likert scale using the following responses: 5 - strongly agree, 4 – agree, 3 - uncertain, 2 – disagree and 1 - strongly disagree. The mean scores were arbitrarily scaled as follows: very high (4.20 – 5.00), high (3.40 – 4.19), moderate (2.60 – 3.39), low (1.80 – 2.59), and very low (1.00 – 1.79). Class loads covering three academic years (6 semesters, excluding summers) were included in the instructional workload. Data gathered were subjected to computer-processed statistics using the Statistical Package for Social Sciences (SPSS) Software. The descriptive statistics used in the study were frequency count, percentage, mean and standard deviation. The inferential statistics

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 4 of 10

used were: t-test for independent samples, one-way analysis of variance (ANOVA), and the Pearson r. The alpha level of significance was set at 0.05.

(12) Results and Discussions (This part contains presentation of results (data) with reference to the table and figure, to be followed by discussion, with support of reviewed literature. Sequence shall be based on the objectives of the study. Tables are formatted without the vertical lines. Horizontal lines are set at the top and bottom portions as well as below table headings and above major subdivisions. Justify paragraphs with main headings in caps.

Level of Instructional Workload Engagement of Faculty Members

Table 1. Mean and Standard deviation of Instructional Workload

	Mean	Description	SD
Instructional Workload	21.70	Heavily loaded	5.21

Scale	Description
above 21 units	Heavy loaded
16-21 units	Rightly loaded
below 15 units	Lightly loaded

Data on Table 1 reveals the level of instructional workload of faculty. It was found out that faculty members are “Heavily loaded” (M = 21.70, SD = 5.21). This means that faculty members exceed the prescribed units the faculty have to handle. Usually, teachers who have more instructional workload could perform better on the different tasks assigned to them. Hines and Hingham (1996) states that faculty productivity is also determined on the extent of class load assigned to them.

Level of Research Engagement of Faculty Members

Table 2. Mean and Standard deviation of Research Engagement

	Mean	Description	SD
Research Engagement	3.43	High	.51

Scale	Description
4.21-5.00	Very high
3.41-4.20	High
2.61-3.40	Average
1.81-2.60	Low
1.00-1.80	Very low

Results on Table 2 show that when grouped entirely the level of the faculty’s research engagement is “high” (M = 3.43, SD = .51). This implies that the faculty are motivated to be engaged in research. Results of the investigation is in line with that of Gilmore and Feldon (2010) which indicates that faculty are now aware of the importance of research in their teaching profession. Thus, they have to come up with the demand of their universities for more research outputs as to compete with other universities in areas of research. Moreover, Clemena and Acosta (2012) mentions that research culture in state colleges and universities are already into turning positively because of their foreseen benefit they are able to get from it.

Differences in Instructional Workload of Faculty Members

Table 3a. t-test Result in Instructional Workload Across Sex

Variable	Sex	Mean	SD	t	Df	Sig
Instructional Workload	Male	22.36	4.72	.52	28	.604
	Female	21.32	5.56			

Table 3a reflects t-test results of the respondents' instructional workload across sex. Statistical analysis shows that there is no significant difference on the level of oral skills of the respondents when classified as to sex [$t(28) = 0.52$ and $p = 0.604$]. It indicates that the instructional workload of the faculty has nothing to do their age. Findings is in concurrent with the study of Middaugh (2001) which states that sex is not connected to the workload of faculty members.

* $p < 0.05$ significant @ 5% alpha level

Analysis of variance in Table 3b reveals that there are significant differences on the level of instructional workload of the faculty when classified as to age [$F(2, 27) = 5.42$ with $p = .010$]; civil status [$(2, 27) = 3.68$ with $p = .039$]; length of teaching service [$F(2, 27) = 4.86$ with $p = .016$]; educational attainment [$F(4, 25) = 7.32$ with $p = .000$]; position [$F(3, 26) = 6.36$ with $p = .002$]; and family monthly income [$F(2, 27) = 8.34$ with $p = .002$]. Data showed that the level of instructional workload of the teachers are affected by their civil status, length of teaching service, educational attainment, position and monthly family income. This further indicates that middle-aged faculty members (30-40 years old) are able to handle well higher instructional workloads than younger (below 30) older faculty (41 and above). This might be due to the fact they are still physically active and have enough teaching experience. Same is true with civil status which indicates that single faculty are able to handle more workloads than married faculty which may be attributed to less home responsibility of single faculty. In same token, those who are master's degree holder, instructors, and 10 years and below in the service are given more workload. This might be due the fact that those with doctorate degrees, more than 10 years and associate professors are given higher positions/designations. Moreover, those who have salaries/income of less than 30,000 are having more workload hence they want to prove their teaching performance which is one bases for promotion. Results of the study run in concurrent with the study of Gomez (2012) which indicates that socio-demographic profile of teachers affect their instructional workload hence schools should consider teachers personal profile in determining the load assignment as to improve school performance.

Differences in Research Engagement of faculty Members

Table 4a. t-test Result in Research Engagement Across Sex

Variable	Sex	Mean	SD	t	Df	Sig
Research Engagement	Male	3.48	.41	.42	28	.677
	Female	3.40	.57			

$p > 0.05$ (not significant @ 5% level)

Results of *t*-test on Table 4a show that there is no significant difference on the level of research engagement of faculty when classified to sex [$t(28) = 0.42$ and $p = 0.677$]. The non-significant difference on the faculty's level of research engagement does not change with regard to their sex. Results of the study is in line with that of Moore and Ward (2010) which states sex is not a factor in determining research engagement of faculty. According to his study, regardless of sex teachers can have interest in research it depends mostly on their motivation, experience and academic background and the need for promotion and professional development.

*p<0.05 significant @ 5% alpha level

Analysis of variance in Table 4b reveals that there are significant differences on the level of research engagement of the faculty when classified as to age [$F(2, 27) = 18.57$ with $p = .000$]; civil status [$F(2, 27) = 5.41$ with $p = .011$]; length of teaching service [$F(2, 27) = 8.98$ with $p = .001$]; educational attainment [$F(4, 25) = 10.16$ with $p = .000$]; position [$F(3, 26) = 22.95$ with $p = .000$]; and family monthly income [$F(2, 27) = 10.50$ with $p = .000$]. Findings of the study reveal that the research engagement of the faculty are affected by their age, civil status, length of teaching service, educational attainment, position and family monthly income. This further indicates that older faculty (Above 41 years old) are more engaged in research than younger faculty (below 30) older faculty (41 years old and above). This might be due to the fact they are still physically active in engaging in different research activities compared to their older counterparts and have more experiences in research compared to younger faculty. It indicates that indicates that married faculty have higher research engagement compared to single faculty. Those who are doctorate degree holders, associate professors, and 10 to 20 years in the service have higher research engagement. Moreover, those who have salaries/income above 40,000 displays have better research engagement hence research plays important role for promotion/reclassification which has positive impact to salary/monthly income. Results of the study is in line with that of Mahilum (2010) which states that some of the socio-demographic characteristics of the respondents such as age, educational attainment and position or designation of the faculty are affecting their engagement in research.

Relationships Between Instructional Workload and Research Engagement of Faculty Members

Table 5. Pearson r Between Instructional Workload and Research Engagement

	r	Sig
Instructional Workload and Research Engagement	(-).619*	.000

*p<0.05 significant @ 5% alpha level

Table 5 reflects the relationships between instructional workload and research engagement of faculty members. The findings reveal that highly significant relationships between the respondents' instructional workload and research engagement [$r = (-) 0.619$, $p = .000 < 0.05$]. Data showed that the faculty's instructional workload and research engagement are interrelated with each other, thus, the faculty's instructional workload determines their research engagement. This correlation signifies that the less or averagely loaded faculty the less they are engaged in research. This further implies that one of the hindrances of the faculty to engage in research the unequitable instructional workload. Findings of the study is in line the study of Alim and Diocolano (2011) which states that faculty workload is related to research engagement.

13) Conclusions and Recommendations (This part shall be written in narrative form and arranged based on the objectives and findings. Conclusions are general statements answering the objectives. Recommendations are based on the conclusions. They may be split or combined based on their length, which means, conclusions and recommendations may be split under separate headings if they are long. Justify paragraphs with main headings in caps.)

Conclusions

1. As revealed, the faculty were "highly loaded." This means that teachers' inequitable instructional workload which may be a hindrance to come up with quality instruction which is the core function of the faculty and support functions like holding designations, conducting research and extension activities and among others.

2. The faculty's research engagement turned out to in "high" level. This may imply that teachers have somehow high research engagement. It is due to the fact that these teachers are employed in HEI where in research is one of the most important areas they should engaged with.

3. The significant difference on the level of instructional workload of faculty members when classified as to age, civil status, educational attainment, position, number of years in service and family monthly income means that the instructional workload of teachers is affected with their above-mentioned profile. Middle-aged faculty are given more instructional load hence they are still energetic have less school responsibilities compared to older faculty who already suffer physical deterioration and assume greater school responsibilities. The higher the education, the more they are authority in their field so their loads might be decreased due to other assignments related to their field. The higher the position the teachers have their instructional workload are lightened for them to perform better in important duties in line with their profession. Mostly, new faculty in the service are given more instructional load than those who are already long in teaching service in a sense that those who are old in

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 9 of 10

the academe are already occupying higher positions in school. Class overload are usually given to faculty who have smaller income hence they want to augment their income from their overload pay/COC.

4. The significant difference on the level research engagement of faculty members when classified as to sex, age, civil status, educational attainment, position, number of years in service and family monthly income signifies that their research engagement varies according to their said profile. Although younger faculty are possessed enthusiasm to explore in research, older faculty have edge over them due to experience and higher educational attainment. Moreover, married faculty are more engaged in research than their single counterpart because they might have anticipated its benefits for promotion which entail higher salary needed in supporting financial needs of the family. Educational attainment matters in research engagement, hence faculty with higher education could conduct better researches due to advanced scholastic training. Those faculty holding higher position or academic rank are more engaged in research because that is part of their function and they are mandated to conduct faculty researches. Furthermore, faculty members who have higher income are more into research they have enough resources for their own researches.

5. The significant relationship between instructional workload and research engagement of the faculty entails that the latter is dependent to the former. Basically, those who are lightly or averagely loaded faculty are those who are highly engaged in research while those who are heavily loaded are those who are less engaged in research.

Recommendations

1. Faculty members should always come up with more activities and innovations in fostering quality instruction and other functions most particularly if their workload is reasonable for them to perform their core and support functions. On the other hand, school officials should always implement the CHED's guidelines regarding faculty loading in order for the faculty to improve their services they may be in instruction and other functions.

2. Faculty are encouraged to continue conduct quality researches and present them in different forums. They may continue to attend seminars and trainings to develop their research skills. Deans/program chairs and administrators may continue to develop research culture in their department/college or campus by creating activities that will encourage faculty to be more engaged in research like applying research findings on their classes, discussing results among them, developing research coaching and providing services for research advising and editing. Reward system in research may also be more strengthened.

3. The program chair/ dean must be reasonable in giving instructional workload to their teachers in view of their age, civil status, educational attainment, position, number of years in service and family monthly income.

4. Although, all faculty need to be engaged in research, program/chairs and administrators may identify those who need to be more encouraged to engage in research considering the faculty's age, civil status, educational attainment, position, number of years in service and family monthly income.

5. Moreover, program chairs/deans, and college directors/administrators are encouraged to continue to practice correct faculty work loading as to balance research and instruction functions of the faculty. In this respect CHED and University guidelines about faculty loading needs to religiously observed.
