-----------------------------	--

(9) Rationale (State the research problem and significance of the project to the current needs of the country. The proposal should justify resource expenditure. A typical justification would include a brief introduction, a general statement concerning the historical basis for R & D and, thrusts being addressed, utilization of the expected output and the impact information generated will have on science, the target users and the country.)

The basis for human existence and welfare is the biological diversity of life on earth. Biodiversity is the product of the interactions between many physical and biological processes across time (Boero & Bonsdorff, 2007; van der Plas, 2019). Humanity is protected against natural disasters by biodiversity and healthy ecosystems, which also control the climate and give people access to food, fertile soil, and health care (WHO, 2015). Unfortunately, recent anthropogenic activities have significantly impacted biodiversity resulting in its rapid decline (Halpern et al., 2008, 2015). If left unabated, this alarming biodiversity loss can potentially impair the capacity of ecosystems to support and sustain life over time (Ayyad, 2003; Butchart et al., 2010; Cardinale et al., 2012; Reich et al., 2012; Worm et al., 2006). Due to these anthropogenic impacts on biodiversity, conservation efforts have been implemented to mitigate biodiversity loss and to promote the recovery of affected ecosystems and species. However, efforts to conserve biodiversity could potentially be ineffective, or even counterproductive, if there is lack of understanding of the fundamental processes underlying biodiversity (e.g., Hoveka et al., 2020; Santangeli et al., 2013). Thus, an understanding of biodiversity and the processes underpinning it is necessary in order to improve the efficacy of conservation efforts.

The above premises described the importance of biodiversity to human well-being and thus conservation and protection efforts should be put into action. Hence, the researcher selected this study entitled Sitio Culasi Residents' Perspective and Attitude Towards Biodiversity Conservation and Protection, to determine how well the residents are informed about biodiversity, what are their attitudes towards its conservation and protection and what factors affects those variables.

(9-A) Project Description (Discuss the project strategy and plan of action of the project. It should also describe the technical procedures and other works needed to carry out the project objectives. The relationship of the project inputs and activities should be explained clearly in this section. Projects similar/related to the proposed project should be mentioned. .)

(10) Objectives/Statement of the Problem (for Social Sciences) (Statement of the specific purpose to address the problem areas of the project.)

This study will generally aim to find out Sitio Culasi residents' perspective and attitude towards biodiversity conservation and protection. Specifically, it will seek to answer the following questions:

1. What is the socio-demographic profile of Sitio Culasi residents in terms of sex, and educational attainment?
2. What is the level of Sitio Culasi residents' perspective towards biodiversity conservation and protection as a whole and when grouped according to profile variables?
3. What is the level of Sitio Culasi residents' attitude towards biodiversity conservation and protection as a whole and when grouped according to profile variables?
4. Are there significant differences on the level of the residents' perspective and attitude when grouped according to profile variables?

5. Is there a significant relationship between the level of Sitio Culasi residents' perspective and attitude towards biodiversity conservation and protection?

(11) Review of Literature/Prior Art Search (Related researchers/activities that have been conducted. State-of –the-art of current technology / information from which the project proposal will take-off).

Biodiversity is said to be the variety of lifeforms at different levels across different spaces and times. It includes the diversity of species, genetics, and ecosystems, and these varieties are found within the aquatic, terrestrial, and marine ecosystems (Duan et. al., 2022). Human survival depends on biodiversity for various needs in life (Van Weelie et. al., 2018). This ranges from agrobiodiversity, which provides food for mankind, to ecosystem diversity, which sustains all life forms. Other services that biodiversity provides to man include maintenance of the nutrient cycle, flood controls, maintaining the hydrological cycle, and climate regulation (Franzolin et. al., 2021).

A vital part of many priceless ecosystem services for human survival, welfare, and prosperity is biological diversity. For instance, many elements of a person's home, such as food, the wood used to construct it, fresh water from faucets, and fuel for stoves, are provided for, governed by, or supported by biodiversity (Sukhdev, 2013).

However, because of deforestation and the disturbances on the natural habitat, the world's biodiversity is rapidly declining and this has an alarming effect on the functions of ecosystems as a specific sub-unit of biodiversity (Maestre et al. 2012). In the past 20 years remarkable progress has been made towards understanding how the loss of biodiversity affects the functioning of ecosystems and thus affects society. Soon after the 1992 Earth Summit in Rio de Janeiro, interest in understanding how biodiversity loss might affect the dynamics and functioning of ecosystems, and the supply of goods and services, grew dramatically. Major international research initiatives formed; hundreds of experiments were performed in ecosystems all over the globe; new ecological theories were developed and tested against experimental results (Cardinale et al. 2012).

It has been estimated that about 68% of biodiversity has been lost over the last five decades, and about one million plants and animal species are threatened with extinction as a result of anthropogenic activities (Cianfagna et. al., 2021). For these reason, there is a need to intensify activities to renew the health of our biodiversity. If not, it would disturb daily activities of human lives or worst the activities and interaction inside the ecosystem.

According to Roe et. al., (2019) biodiversity loss is an issue that could challenge the humanity's developmental priorities such as health and food security. Biodiversity is not just about wildlife but it encompasses the diversity of life from genes and microorganisms to the top predators of the ecosystem. As humans are dependent on biodiversity, its loss could greatly affect their lifestyle in addition to the threat of climate change.

Poor people are the first and are the most affected with destruction of biodiversity. Since humans depend all their needs to biodiversity, its destruction will first affect those who cannot afford to buy. People who depend their foods on their environment such as the farmers will be affect with the imbalance on ecosystem or with the climate change. Proteins that they get from meat will also be affected if meat production lessen. Yet the destruction of biodiversity due to human activities is still around 1000 times faster than natural backgrounds rate (Roe et. al., 2019).

It is during the Anthropocene – the period which is described to be the peak of the industrial revolution is when human activities started to disturb the naturally occurring balance on the Earth's environment and as the disturbance increased, humanity felt its effects and started attempts to restore balance. Unfortunately, the current anthropogenic factors that drives biodiversity loss were just overwhelming and thus attempts to do so point to an inescapable conclusion: humanity are losing biodiversity at an unprecedented rate. Biodiversity needs to be taken care of as it plays a critical part in maintaining the natural systems of the biosphere which are fundamental to human existence on the earth (Burkmar et. al., 2015).

If we look back to as early as the 1980s, the major cause of biodiversity loss is human action, primarily land use that alters and degrades habitat to serve human needs (Gadjil, 1996). On a much recent data from the Global Assessment Summary of the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystems Services (IPBES), they outlined five direct drivers of biodiversity loss, in order of the largest global impact: 1) changes in land and sea use 2) direct exploitation of organisms 3) climate change 4) pollution and 5) invasive species (IPBES, 2019).

			Page	Page 4 of 9

With this data, it can be resolved that human activities towards the environment are the top contributor in biodiversity loss. On the other hand, Morar & Peterlicean, (2012) stated that it is also humans especially the children and youth are the two most significant actors that can prevent the total loss of biodiversity and natural resources. Educating them at an early age can help improve their perspective and be fighters for biodiversity through active involvement in conservation and protection of natural resources (Šorytė & Pakalniškienė, 2019).

Biodiversity Conservation

Conservation of nature is crucial for the healthy growth of social and economic life. Pollution and environmental protection constitute a significant concern nowadays. New approaches are required to preserve the ecological balance in light of the changes taking place on the world. The harmful repercussions of this imbalance are particularly evident in the low biodiversity. Numerous species are in danger of extinction, according to studies, while more than 300 species have already vanished. To lessen the burden on rare species, it is therefore vital to develop concepts and carry out projects for the conservation of biodiversity in protected natural areas (Morar and Peterlicean, 2012).

Conservation of biological diversity and sustainable use of its components came into the limelight in 1972 United Nations Conference on Human Environment; Stockholm. The need for obtaining a legislative mandate for the conservation of global resources arose after UNEP designated biodiversity conservation as a priority area in 1973. The Convention on Biological Diversity was established in 1992 in Rio de Janeiro as part of the United Nations Conference on Environment and Development (UNCED)/Earth Summit after negotiations for a legally binding instrument to address biological diversity and its loss to improve fairness and equity in the sharing of the benefits of biodiversity. The convention was motivated by the rising concern for sustainable development on a global scale. The convention's goals were to conserve biological diversity, use its components sustainably, and share its benefits fairly and equally. It was the first comprehensive global agreement to address the full range of biological diversity issues, including genetic resources, species diversity, and ecosystem diversity (un.org, 2022).

(12) Scientific Basis/Theoretical Framework (Include concepts, theories and variables that indicate relevant relationships to be tested.

This study is anchored on the following theories namely; Ecological Niche Theory by Hutchinson (1957), Theory of Change (ToC) by Rice et al., (2020), and Self-Perception Theory by Bem (1967).

Ecological Niche Theory

According to Khatibi (2016), ecological niche is the position or function of an organism or a population within a biological and physical environment. The ecological niche concept, as proposed by Hutchinson (1957), expresses the relationship of an individual or a population to all aspects of its environment.

This theory gives explanation as to why people have different attitudes and perspectives about the protection and conservation of biodiversity. In an article from the International Institute for Environment and Development (IIED) it was mentioned that negative attitudes towards conservation can drive people towards wildlife crime. Previous IIED-led research at Murchison Falls Conservation Area (MFCA) found that resentment over a lack of income earning opportunities and a lack of support from park authorities to address human-wildlife conflict (HWC) was driving local people to engage in illegal hunting or wildlife trade within protected areas (IIED, 2021).

This theory relates to this study as it explains the relationship between the human population and the environmental resources around them. It would give meaning to the perspectives and attitude of the respondents towards biodiversity conservation and protection and explain what affects their actions towards the environment.

Theory of Change

This study is also based on the Theory of Change (ToC) presented by Rice et al., (2020). Theory of Change is challenging as it can simultaneously be considered a way of thinking, a process and/or a product (Davies, 2018). Theory of Change essentially involves logically “mapping” what needs to happen in a pathway for a sequence of actions, and assumptions made, to achieve an intervention's desired result. The explicit purpose of the Theory of Change (ToC) approach, is to promote understanding of how and why an intervention works, and the processes that bring about “positive” change (Mayne, 2015).

Proponents of this theory presented the development of robust, well-informed conservation pathways that

identification of respondents)										
2. Writing the proposal (formulation of frameworks/approaches & methods; proposal presentation)										
3. Implementation (conduct of the research study, data gathering & analysis, review & comparison)										
4. Results & report writing (analysis of result, conclusion & recommendations)										
5. Publication of results										

(15) Expected Output (Indicate the specific products, processes or services which the project is expected to produce; quantify when possible)

The result of this study may provide the administrator with the necessary data and related information on formulating appropriate environmental programs and activities for the students. Based on the result of this study, the administrators would have an idea for a more environmentally inclined curriculum intervention.

This study may also be helpful to the parents for they would be aware of their roles and responsibilities, determine the strengths and weaknesses of their children in conservation and protection of biodiversity.

Students may also benefit from the results of this study. They would be able to assess themselves and enhance their practices in terms of biodiversity conservation and protection. In addition, this study would also give them ideas about the importance of biodiversity.

The findings of this study may also provide teachers a comprehensive insight on the different methods of how they can teach that would lead to the conservation and protection of biodiversity. Hence, students do not just learn but also utilize and apply their knowledge to initiate activities that protects the environment.

The findings of this study may help the local government unit in the implementation and establishment of the different regulations, laws, and programs that would help protect and conserve biodiversity. Knowledge on the students' perspective and attitude towards biodiversity conservation and protection would be effective in formulating more suitable and effective education programs and conservation activities.

Lastly, this study may give other researchers baseline data on the perspective and attitude of students towards biodiversity conservation and protection. They may use it as bases and source of their future studies which would further generate new and existing ideas.

(16) Technology Transfer Activity Design (Indicate the specific products, activity design, processes or services to be transferred as extension activities)
