(9A) Abstract (This has a maximum of 250 words. It contains 1-2 sentences of rationale, followed by objectives, brief methodology, major findings, and implications of impact of the study.)

Many anthropogenic activities have significantly impacted biodiversity and if left unabated can potentially impair the capacity of ecosystems to support and sustain life over time. This descriptive-correlational study aims to illuminate the perspective and attitude of Sitio Culasi residents towards terrestrial biodiversity conservation and protection along with the association of the variables involved to address necessary measures. It employs statistical tools such as, frequency count, mean, standard deviation, percentage distribution, T-test, ANOVA, and Pearsons r for data analysis. The 268 respondents in the study primarily consisted by female, ages below 49 years old, who gained an income ranges from 6000 to 10000 pesos and underwent high school. Results indicate that both the level of perspective and attitude towards terrestrial biodiversity conservation and protection were “high” and “favorable” respectively. Moreover, there are significant differences in terms of age, family income and educational attainment of the respondents in the level of perspective and attitude towards terrestrial biodiversity upkeep. These means that the older group of people, with less family income, and with lower educational background must be given some additional knowledge and deeper understanding on taking good care of our environment and everything living in it. Additionally, Sitio Culasi residents’ perspective and attitude towards terrestrial biodiversity conservation and protection were found to be significantly related. Hence, their attitude towards terrestrial biodiversity conservation and protection was affected by their perception.

(9B) Keywords (Write 3-6 words you used in the study, preferably not found in the title because words in the title are already given keywords. This would also include process, or methodology employed.)

Terrestrial Biodiversity, Perspective, Attitude, Conservation, and Protection

(10) Introduction (This includes the rationale, background of the study, and objectives which are not divided by subheadings. Incorporate at least three (3) reviews)

The basis for human existence and welfare is the biological diversity of life on earth. Humanity is protected against natural disasters by biodiversity and healthy ecosystems, which also control the climate and give people access to food, fertile soil, and health care (WHO, 2015). However, biodiversity is now starting to decline, and a large portion of the world's most significant biodiversity hotspots are found in nations that are struggling with poverty, food insecurity, and accelerating climate change (Roe et. al., 2019). In order to save the biodiversity from total destruction, there is a need for people to be aware of their roles as stewards of nature.

The term “biodiversity” refers to the variety of genes, species and ecosystems, occurring in a given system (Redford and Mace, 2018). Human societies depend on biodiversity to obtain essential goods like food, fiber, and potable water and for the correct provision of ecosystem services such as biomass production or nutrient and water recycling (Cardinale et al., 2012). According to the Convention on Biological Diversity (CBD) during the 1992 United Nations Conference on Environment and Development “biodiversity is the variability among living organisms from all sources including, inter alia, terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are part; this includes diversity within species, between species and as well as that of ecosystems.”

Over the past four decades, biodiversity has declined in such alarming rate that the present rate of species loss is estimated to be 1,000 times higher than the background extinction rates typical over Earth’s history, occurring across the globe in all taxonomic groups (Saez et al., 2019). In the much recently released Global Assessment Report from the Intergovernmental Science Policy Platform on Biodiversity and Ecosystem Services (IPBES) estimated that “up to one million species are threatened with extinction”. The threats to biodiversity are due to multiple anthropogenic and environmental

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
			Revision No.	00
	Document Title:	COMPLETED RESEARCH	Effective Date	
			Page	Page 3 of 16

drivers with climate change and land-use change being amongst the most prominent ones (IPBES, 2019).

Aware of the importance of biodiversity for human well-being, the international community has put in place diverse agreements to reduce or mitigate the rate of biodiversity loss. The adoption of the ‘Strategic Plan for Biodiversity 2011-2020’ of the Convention on Biological Diversity (CBD) increased societal responses and important efforts targeted to halve the rate of biodiversity loss. However, biodiversity continued to decline and the progress has been insufficient to achieve this target (CBD, 2014).

The present generation, especially the children and youth are the two most significant actors that can prevent the total loss of biodiversity and natural resources (Morar & Peterlicean, 2012). Educating them at an early age can help improve their perspective and be fighters for biodiversity through active involvement in conservation and protection of natural resources (Šorytė & Pakalniškienė, 2019).

The above premises described the importance of biodiversity to the human well-being and thus conservation and protection efforts should be put into action. Hence, the researchers chose this study entitle Perspective and Attitude of Students Towards Biodiversity Conservation and Protection to determine how well the students are informed about biodiversity, what are their attitudes towards its conservation and protection and what factors affects those variables.

Statement of the Problem

This study generally aims to find out the Sitio Culasi residents’ perspective and attitude towards terrestrial biodiversity conservation and protection. Specifically, it seeks to answers the following questions:

1. What is the respondents’ level of perspective towards terrestrial biodiversity conservation and protection as a whole and when grouped according to profile variables?
2. What is the respondents’ level of attitude towards terrestrial biodiversity conservation and protection as a whole and when grouped according to profile variables?
3. Are there significant differences on the respondents’ level of perspective and attitude towards terrestrial biodiversity conservation and protection when grouped according to profile variables?
4. Is there a significant relationship between the respondents’ level of perspective and attitude towards terrestrial biodiversity conservation and protection?

(11) Materials and Methods or Methodology (This includes the materials, methods,duration & location of the study. Materials and Methods are headings used in Natural Science researches and methodology is Social Sciences. Presentation of materials may not necessarily be in separate heading but may be incorporated in the specific methods used. Justify paragraphs with main headings in caps.)

The descriptive-correlation research design was used in this study. According to Manjunatha (2019), descriptive research describes the characteristics of the population or phenomenon that is being studied. This methodology focuses more on the “what” of the research subject rather than the “why” of the research subject. A descriptive study determines and reports the way things are. Descriptive research is scientific research that describes about event, phenomena or fact systematically dealing with certain area or population.

To provide a wider perspective in giving relationship to the variables in addition to the static pictures from the descriptive design, this study also employs a correlational research design. Correlational research involves the measurement of two or more relevant variables and an assessment of the relationship between or among those variables. The goal of correlational research is to uncover variables that show systematic relationships with each other (Stangor, 2011).

These approaches are centered on gathering statistical data to generalize it across groups of people to give details on a particular phenomenon (Barbie, 2010). The researchers would be able to

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 4 of 16

successfully explore the association between the variables using the approaches presented that are most suited for this study.

The respondents were 48 household residents of Sitio Culasi, Brgy. Lonoy, Sapián, Capiz.

The data gathered by the researcher were obtained using an adapted questionnaire.

The researcher personally distributed and retrieved the questionnaires.

Before the entries in the questionnaires were encoded, the information provided by the respondents was first edited by the researcher with the help of the statistician. Then, the edited questionnaires were numbered for encoding into the data matrix and then finally processed.

For descriptive data, statistical tools such as frequency count, percentage, and mean were used in the analysis of the data. For inferential analysis, T-test, ANOVA and Pearsons r were used.

(12) Results and Discussions (This part contains presentation of results (data) with reference to the table and figure, to be followed by discussion, with support of reviewed literature. Sequence shall be based on the objectives of the study. Tables are formatted without the vertical lines. Horizontal lines are set at the top and bottom portions as well as below table headings and above major subdivisions. Justify paragraphs with main headings in caps.)

Profile of Respondents

Table 2 presents the profile of the respondents in terms of sex, age, family income, and educational attainment.

Sex

The table reveals that majority of the respondents were females (52.20%) and 47.80% were males. This implies that most of the respondents of the study were females.

Age

The same table shows the distribution of respondents according to their age. The data shows that most of the respondents were below 49 years old (75.00%) and 25.00% were 49 years and above with mean and standard deviation of $M = 36.21$ and $SD = 13.48$ respectively. This implies that most of the respondents of the study were in their mid-thirties.

Family income

The data revealed that 64.20% of the respondent's family income ranges from P6000 to P10000 pesos, 25.00% have an income range from P11,000 pesos and above, and 10.80% have an income of P5,000 pesos and below with mean and standard deviation of $M = 9472.01$ and $SD = 3281.91$ respectively.

Educational Attainment

As presented in the table, 39.20% of the respondents undertaken high school, 35.40% undertaken elementary, 19.00% are college level, and 6.30% are college graduate.

Table 2. Profile of the respondents

Characteristics	Frequency	Percentage
Sex		
Male	128	47.80
Female	140	52.20
Total	268	100.00
Age		
Below 49 years old	201	75.00
49 years old and above	67	25.00
Total	268	100.00
Mean	36.21

SD	13.48	
Family Income		
5000 and below	29	10.80
6000 to 10 000	172	64.20
11 000 and above	67	25.00
Total	268	100
Mean	9 472.01	
SD	3281.91	
Educational Attainment		
Elementary	95	35.40
High School	105	39.20
College Level	51	19.00
College Graduate	17	6.30
Total	268	100.00

Level of Perspective towards Terrestrial Biodiversity Conservation and Protection

As shown in Table 3, 61.60% of the respondents obtained a very high level of perspective towards terrestrial biodiversity conservation and protection. 32.50% has a high perspective and the remaining respondents (6.00%) obtained an average level of perspective. As a whole, the data revealed that the respondents had a high level of perspective towards terrestrial biodiversity conservation and protection as indicated by the mean of 4.15.

Table 3. Level of Perspective towards terrestrial biodiversity conservation and protection

VARIABLE	FREQUENCY	PERCENTAGE
Very High	165	61.6
High	87	32.5
Average	16	6.00
TOTAL	268	100.00
Mean = 4.15 (High)		

Level of Perspective towards Terrestrial Biodiversity Conservation and Protection when Group According to Profile Variable

Sex

Data in Table 4 revealed that both male and female have high level of perspective towards terrestrial biodiversity conservation and protection indicated by the mean 4.14 and 4.16 respectively. This means that irrespective of sex the good standpoint towards the conservation and protection of terrestrial biodiversity is comparable.

Age

The same table shows that those below 49 years old has a mean score of 4.28 categorized as “very high” while those respondents from 49 years old and above has a mean score of 3.77 and categorized as “high”. This means that the younger generations have a good viewpoint on the conservation and protection of biodiversity.

Family Income

The same table shows the family income of the respondents where those with below P 5,000 and P 6,000 to P 10,000 pesos income have mean scores of 3.82 and 4.14 respectively and categorized as “high”. On the other hand, those with P11,000 pesos and above income has a mean score of 4.34 and is categorized as “very high”. This denoted that the higher the income of a certain family also have good viewpoint on the conservation and protection of terrestrial biodiversity

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 6 of 16

Educational Attainment

the same table revealed in terms of educational attainment, the respondents who undergone high school, college level, and college graduate has “very high” perspective towards biodiversity conservation and protection with means 4.23, 4.30, and 4.21 respectively. While those who undergone elementary education with a mean score of 3.96 were categorized as “high”. This means that the educational attainment really matters as to how they view the importance of conservation and protection towards terrestrial biodiversity.

Table. 4 Level of Perspective towards terrestrial biodiversity conservation and protection when grouped according to profile variables

VARIABLE	MEAN	INTERPRETATION
Sex		
Male	4.14	High
Female	4.16	High
Age		
Below 49 years old	4.28	Very High
49 years old and above	3.77	High
Family Income		
5 000 and below	3.82	High
6 000 to 10 000	4.14	High
11 000 and above	4.34	Very High
Educational Attainment		
Elementary	3.96	High
High School	4.23	Very High
College Level	4.30	Very High
College Graduate	4.21	Very High

Level of Attitude towards Terrestrial Biodiversity Conservation and Protection

As shown in Table 5, 50.00% of the respondents obtained a “very favorable” level of attitude towards biodiversity conservation and protection, 44.00% were “favorable” and the remaining respondents (6.00%) obtained a “neutral” level of attitude. As a whole, the data revealed that the respondents had a high level of attitude towards terrestrial biodiversity conservation and protection as indicated by the mean of 4.61.

Table 5. Level of Attitude towards terrestrial biodiversity conservation and protection as a whole

VARIABLE	FREQUENCY	PERCENTAGE
Very Favorable	134	50.00
Favorable	118	44.00
Neutral	16	6.00
TOTAL	268	100.00
Mean = 4.19 (Favorable)		

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 7 of 16

Level of Attitude towards Terrestrial Biodiversity Conservation and Protection when Group According to Profile Variable

Sex

Data in Table 6 revealed the level of attitude of respondents towards terrestrial biodiversity conservation and protection when group according to sex. Data showed that both male and female have “favorable” attitude towards biodiversity conservation and protection with a mean 4.19 and 4.18 respectively. This means that regardless of sex, respondents have a good reflection on the conservation and protection of terrestrial biodiversity.

Age

The same table shows that those below 49 years old has a mean score of 4.31 categorized as “very favorable” while those aging from 49 years old and above have mean score of 3.81 and categorized as “favorable”. This means that younger respondents have much care on how to conserved and protect biodiversity.

Family Income

The same table shows that, in terms of family income, those below P 5,000 and P 6,000 to P 10,000 pesos have mean scores of 4.02 and 4.17 respectively and categorized as “favorable”. On the other hand, those with P 11,000 pesos and above income have mean score of 4.30 and categorized as “very favorable”. This means that those who have higher income have good insights or vision on terrestrial biodiversity conservation and protection

Educational Attainment

The same table shows the respondents educational attainment, where the respondents from high school, college level, college graduate have “very favorable” attitude towards terrestrial biodiversity conservation and protection with means of 4.27, 4.36 and 4.22 respectively. While those who undergone elementary education has mean scores of 3.99 and were categorized as “favorable”. This means that education can give a very good foundation in the conservation and protection of biodiversity.

Table 6. Level of Attitude towards biodiversity conservation and protection when grouped according to profile variables

VARIABLE	MEAN	INTERPRETATION
Sex		
Male	4.19	Favorable
Female	4.18	Favorable
Age		
Below 49 years old	4.31	Very Favorable
Town	3.81	Favorable
Family Income		
5000 and below	4.02	Favorable
6000 to 10 000	4.17	Favorable
11 000 and above	4.30	Very Favorable
Educational Attainment		
Elementary	3.99	Favorable
Highschool	4.28	Very Favorable
College Level	4.36	Very Favorable
College Graduate	4.22	Very Favorable

Differences in the Level of Perspective towards Terrestrial Biodiversity Conservation and Protection when Grouped According to Profile Variables

The result of the analysis using ANOVA and T-test to determine whether there are significant differences in the level of perspective of respondents towards terrestrial biodiversity conservation and protection when grouped according to sex, age, family income and educational attainment are summarized in Table 7.

Sex

When the respondents were grouped according to sex, the result shows T value of -0.31 with the probability value of 0.756 ($T=-0.31, p>0.05$). Hence, the null hypothesis assuming that there is no significant difference on the level of students' perspective when grouped according to sex is accepted. This result implied that respondents' perspective towards biodiversity conservation and protection regardless of the sex is analogous or parallel.

According to the study of Martin-Lopez et al., (2012), women and men may hold different values concerning biodiversity. For instance, in Spain, women attach more value to the regulating services of ecosystems, such as soil erosion control, while men value more their provisioning services, such as their contributions to livestock raising. This means that men and women may perceive their role on the conservation and protection of biodiversity differently. Nevertheless, they both lean towards contributing in the conservation and protection of biodiversity. This is supported by Brautigam et al., (2018) which stated that women and men both contributes in maintaining the biological resources.

Age

When the respondents were grouped according to age, the result showed a significant difference with T value of 7.75, and with probability value of 0.000 ($T=7.75, p>0.05$). Hence, the null hypothesis assuming that there is no significant difference on the level of respondents' perspective towards terrestrial biodiversity conservation and protection when grouped according to age is rejected. This finding implies that respondents' perspective towards biodiversity conservation and protection differs with age.

Family Income

The result revealed that there is a significant difference on the respondents' level of perspective towards the conservation and protection of terrestrial biodiversity when grouped according to family income with F value of 13.76 and probability value 0.000 ($F=13.76, p<0.05$). Hence, the null hypothesis is rejected. This implies that the respondents' level of perspective towards conservation and protection of terrestrial biodiversity differs.

Educational Attainment

Results further showed that there is a significant difference on the respondents' level of perspective towards terrestrial biodiversity conservation and protection when grouped according to their educational attainment with F value of 11.63 and probability value 0.000 ($F=11.63, p<0.05$). Hence, the null hypothesis is rejected. This implies that the respondents' level of perspective towards terrestrial biodiversity conservation and protection differ in terms of their educational attainment.

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 9 of 16

Table 7: Differences in the level of perspective towards terrestrial biodiversity conservation and protection when grouped according to profile variables

VARIABLES	STATISTICAL TOOLS	F/T VALUE	SIGNIFICANCE
Sex	T - test	T = 1. -031 ^{ns}	0.756
Age	T - test	T = 7.75*	0.000
Family Income	ANOVA	F = 13.76*	0.000
Educational Attainment	ANOVA	F = 11,63	0.000

* -significant at 5% level

ns – not significant

Differences in the Level of Attitude towards Terrestrial Biodiversity Conservation and Protection when Grouped According to Profile Variables

The result of the analysis using ANOVA and T-test to determine whether there are significant differences in the respondents' level of attitude towards terrestrial biodiversity conservation and protection when grouped according to sex, age, family income and educational attainment are summarized in Table 8.

Sex

When the respondents were grouped according to sex, the result showed no significant difference with T value of 1.23 with the probability value of 0.220 ($T=1.23$, $p>0.05$). Hence, the null hypothesis assuming that there is no significant difference on the level of Sitio Culasi residents' attitude when grouped according to sex is accepted. This finding implies that respondents' attitude towards terrestrial biodiversity conservation and protection regardless of the sex are parallel. Respondents, either male or female, has the same behavior towards the conservation and protection of biodiversity.

The results of the study negate the findings of Gökçe and Sarıyar (2019) who concluded that attitudes toward the environment differ in favor of female students. Female students tend to have higher attitudes towards the environment than the male students and it is due to factors such as gender roles, emotional and physiological characteristics, traditions, family, and environmental factors.

Age

When the respondents were grouped according to age, the result shows T value of 8.56 with the probability value of 0.000 ($T= 8.56$, $p>0.05$). Hence, the null hypothesis assuming that there is no significant difference on the respondents' level of attitude towards terrestrial biodiversity conservation and protection when grouped according to age is rejected. This finding implies that respondents' attitude towards biodiversity conservation and protection varies with age.

The result favors the study of Ngo et. al., (2019) who found out that childhood experiences had a significant effect on adult attitude which implies that how the parents introduced the concept of biodiversity conservation and protection based on their level of knowledge to their children would ultimately affect their attitude towards it.

Family Income

Results revealed that there is a significant difference in the respondents' level of attitude towards terrestrial biodiversity conservation and protection when the respondents were grouped according family income. Data shows F value of 4.07 with the probability value 0.018 ($F= 4.07$, $p>0.05$). Therefore, the null hypothesis assuming that there is no significant difference on the level attitude towards terrestrial biodiversity conservation and protection when grouped according to family income is rejected. This means that family income influences the respondents' level of attitude towards terrestrial biodiversity conservation and protection.

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- CR-01
	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 10 of 16

Educational Attainment

Results further showed that there is a significant difference in the respondents' level of attitude towards terrestrial biodiversity conservation and protection when grouped according to educational attainment. Data shows F value of 10.54 with the probability value 0.000 ($F = 10.54, p > 0.05$). Therefore, the null hypothesis assuming that there is no significant difference on the respondents' level of attitude towards terrestrial biodiversity conservation and protection when grouped according to educational attainment is rejected. This means that educational attainment influences the respondents' level of attitude towards terrestrial biodiversity conservation and protection.

Table 8: Differences in the level of attitude towards terrestrial biodiversity conservation and protection when grouped according to profile variables

VARIABLES	STATISTICAL TOOLS	F/T VALUE	SIGNIFICANCE
Sex	T - test	$T = 1.23^{ns}$	0.220
Age	T - test	$T = 8.56^*$	0.000
Family Income	ANOVA	$F = 4.07^*$	0.018
Educational Attainment	ANOVA	$F = 10.54^*$	0.000

* -significant at 5% level

ns – not significant

Relationship between the Level of Perspective and Attitude towards Terrestrial Biodiversity Conservation and Protection

Table 9 reveals the result of the analysis on the relationship of the respondents' perspective and attitude towards terrestrial biodiversity conservation and protection. Data showed that there is significant relationship between the two variables ($r = 0.855; p < 0.01$).

Therefore, the result rejects the null hypothesis which states that there is no significant relationship between the respondents' level of perspective and attitude towards terrestrial biodiversity conservation and protection. It implies that perspective and attitude of the students were related. It further implies that how respondents perceive conservation and protection of terrestrial biodiversity influences the way they react and behave. The higher their perspective the more favorable their attitude towards conservation and protection of biodiversity.

This contends to the study of Kruglanski (2018) that, a person's interpretation or point of view is the focus of perspective and may be a technique for predicting his conduct or how he will act. Determining one's attitude toward the conservation and management practices being or to be used can therefore be aided by understanding one's perspective.

Table 9: Relationship between the level of perspective and attitude towards terrestrial biodiversity conservation and protection

VARIABLE	Perspective on Biodiversity		Attitude Towards Biodiversity	
	r	r prob	r	r prob
Perspective on Biodiversity	1.000	0.000	0.855**	0.000
Attitude Towards Biodiversity	0.855**	0.000	1.000	0.000

** – significant at 1% level

(13) Conclusions and Recommendations (This part shall be written in narrative form and arranged based on the objectives and findings. Conclusions are general statements answering the objectives. Recommendations are based on the conclusions. They may be split or combined based on their length, which means, conclusions and recommendations may be split under separate headings if they are long. Justify paragraphs with main headings in caps.)

Conclusions

Based on findings of the study, the following conclusion were drawn:

1. The respondents' level of perspective towards terrestrial biodiversity conservation and protection as a whole was high. This implies that there are still needs for them to enrich their knowledge and awareness on the conservation and protection of terrestrial biodiversity.
2. As a whole, the respondents' level of attitude towards biodiversity conservation and protection was favorable. This means that there are still needs to develop on the respondents the consciousness and responsiveness on the conservation and protection of terrestrial biodiversity
3. The respondents when grouped according to profile variables such as sex, had no significant influence in their perspective and attitude towards terrestrial biodiversity conservation and protection. Among the variables tested, the age, family income and educational attainment significantly affected the level of perspective and attitude.
4. There was a significant relationship on the respondents' perspective and attitude towards terrestrial biodiversity conservation and protection. Therefore, the attitude of students towards biodiversity conservation and protection was affected by their perception.

Recommendations

Based on the conclusions made, the following recommendations are forwarded:

1. Young people of the area may create organizations and/or club that will cultivate the positive perspective and attitude in the conservation and protection of terrestrial biodiversity and encourage their elders and those who have low family income and educational attainment.
2. The barangay council may conduct symposiums addressing the deteriorating ecosystem which affects the terrestrial biodiversity of the place. Particularly, the participants of the said activity are the elders, with low income and educational attainment.
3. The barangay council may ask assistance to their Municipal Local Government Unit to fund their activities such as the prizes in maintaining the cleanliness in their locality and to sustain and keep the award as the cleanest barangay in Capiz.
4. Lastly, future researchers may integrate other concepts such as the green initiatives of the LGU and other variables on aquatic biodiversity.

(14) Output (Indicate the specific products, processes or services which the project has produced; quantify when possible.)

(15) Technology Transfer Activity Conducted (Indicate the specific products, activity design, processes or services transferred as extension activities)

(17) Acknowledgments (Include only important persons and institutions with involvement in funding and conduct of the research. Justify paragraphs with main headings in caps.)

(18) References (It should include only works mentioned in the text and should be arranged alphabetically. Citations shall not be less than 13 entries. This must follow the APA latest edition format, in hanging indentation with 12-point space in between.)
