(9A) Abstract (This has a maximum of 250 words. It contains 1-2 sentences of rationale, followed by objectives, brief methodology, major findings, and implications of impact of the study.)

This paper focused on the qualitative methods to describe the experience of student - mothers of Capiz State University Burias in the era of full implementation of face to face classes. Purposive sampling was employed in this study to gather eight student-parents. The participants were interviewed using a semi-structured questionnaire. To delve deeper with their experiences, Colaizzi's method was used to collect, record, and analyze data. The researcher formulated three themes from the results as follows: 1) The Stress encountered by the student- mothers, 2) The students' coping mechanism to the challenges they encountered, 3). Students' motivation in pursuing their studies. The student-mothers shared their experience during this of full implementation of face to face classes and narrated how these made an impact in their lives as student-mother. This scenario greatly affected their mental and emotional health and even impacted their studies. Causes, inferences and recommendations based on these findings were discussed.

(9B) Keywords (Write 3-6 words you used in the study, preferably not found in the title because words in the title are already given keywords. This would also include process, or methodology employed.)

(10) Introduction (This includes the rationale, background of the study, and objectives which are not divided by subheadings. Incorporate at least three (3) reviews), and assessment?

The rapid growth in population of students who are parents on university campuses is a concern for many. A greater percent of these students either drop out or delay to graduate. Student-parents are an invisible but growing population on college campuses across the country, yet there is limited research regarding the needs of women who transition to motherhood while enrolled in undergraduate studies.

Some student-parents experience include being sad, lonely, restless, always absent and skipping submission of outputs that affect their performance in school. Moreover, the most common ones are balancing work and family life, dealing with stress, and raising children while attending face to face classes.

It is clear that parenting is a stressful experience that can create distress and anxiety in addition to joy (Deater-Deckard, 2004). The responsibility of a child is often accompanied by changes in lifestyle, late nights taking care of sick or upset children, and the need to rearrange schedules in order to attend important events for a child. In fact, many people have suggested that parenting is like a full time job (DeMeis & Perkins, 1996).

Attending college is also often a full-time job that includes changes to one's lifestyle, such as staying up late to finish papers or other assignments, and rearranging schedules in order to attend class or important out-of-class activities. Given the high levels of responsibility involved in each of these roles, there is no question that being a college student and a parent concurrently can be extremely stressful.

For college students who are parents (hereafter referred to as student parents), what is less clear is how each role contributes to their stress and how stressors are different from those experienced by both college students who are not parents, as well as parents who are not college students. The small amount of available research regarding student parents has suggested that accommodations should be made for individuals balancing multiple roles. Examining the stress that student parents experience more closely, however, is essential for determining how this population can best be helped to navigate their multiple roles successfully. Given that an estimated 16 to 36% of undergraduate students are currently parents (Horn, Nevill, & Griffith, 2006; Horn, Peter, & Rooney, 2002; US Department of Education, 2009).

This population may be more likely to discontinue schooling prematurely than peers without children (Anderson, 2001; Branscomb, 2006; Gerrard & Roberts, 2006; Horn et al., 2006), a better understanding of whom this population is comprised and how student parents fit into the general student population is necessary. The need to better understand this population may be particularly salient for universities that need to maintain high levels of enrollment and should, therefore, help student parents to navigate their multiple roles in a way that will allow them to complete their education.

To this end, the aim of this study is to explore how student-parents experience, navigate and act upon their dual roles during face to face classes.

The main concern of this descriptive phenomenology study is to describe the lived experiences of the student-mothers of Capiz State University Burias Campus in the face to face classes.

More specifically, it sought to provide answers to the following questions:

1. What stress they encountered as student-mothers?
2. What are the coping mechanism that you practice in order to overcome the challenges you have encountered as student mothers?
3. What motivates to pursue your studies?

(11) Materials and Methods or Methodology (This includes the materials, methods, duration & location of the study. Materials and Methods are headings used in Natural Science researches and methodology is Social Sciences. Presentation of materials may not necessarily be in separate heading but may be incorporated in the specific methods used. Justify paragraphs with main headings in caps.)

This study utilized the qualitative research design by conducting surveys through a one-on-one interview. This study employed a descriptive phenomenology by Edmund Husserl. Husserl believed that phenomenology suspended all suppositions, was related to consciousness, and was based on the meaning of the individual's experiences (Reiners, 2012). This study seeks to explore the transition to motherhood as experienced by university student-parents.

Descriptive phenomenology seeks to answer the research questions in a descriptive manner through interviews or observation of those closest to the phenomenon (Davison, 2013). Using purposive sampling, researchers will select individuals for study participation that are especially knowledgeable about or experienced with a phenomenon of interest (Creswell and Plano Clark, 2011). This is an appropriate method to select the participants for a study using a descriptive phenomenological approach because the aim is to understand and describe a particular phenomenon from the perspective of those who have experienced it.

Semi-structured interview questions focusing on the experiences, on stress, motivation, and coping mechanism of the CAPSU Burias student-mothers who were pregnant students and students with infants. This inclusive, pluralistic and complementary form of research (Johnson & Onwuegbuzie, 2004) will be adapted in order to capture participant's life stories. The transcribed interviews conducted by the researcher were the basis to substantiate the data that each conveyed with regards to the experiences encountered by student-parents.

Participants

Participants were officially enrolled at Capiz State University Burias Campus. The participants were composed of eight females with age ranging 22 -25 years old. Likewise, one important factor in this study is the ability of the participants to share her experiences and willingness to impart her lived experiences as student-parents.

Table 1.

Participants	Description
P1	22 years old, COE 4
P2	22 years old, COE 4
P3	23 years old, COE 4
P4	21 years old, COE 4
P5	22 years old, BA 4
P6	25 years old, BSBE 4
P7	24 years old, CAF 4
P8	25 years old, COE 4

Instruments

The researcher used a semi-structured questionnaire interview composed of two parts (2) parts, namely, Part 1 which asked as regards to their information. The second part included open-ended questions to be answered by the participants. The questions were in English and in the native dialect in order to ensure that participants were able to express their ideas and views well. Participants freely discussed their answers and the researchers provided in-depth questions to prompt further explanation.

Sampling and data Gathering

The participants were chosen using purposive sampling. This type of sampling technique is subjective in nature that depends upon the judgment of the researcher regarding the subject to be studied (Creswell, 2013).

Data Analysis

After the data were collected through a semi-structured interview guide. The rich in-depth narratives and responses to questions were transcribed verbatim and analyzed using Colaizzi's method of analysis.

The researcher attempted to understand the meaning embedded in the participants' statements to uncover

			Effective Date	
			Page	Page 4 of 8

common themes. The focus is on how each informant constructs meaning and knowledge through their lived experiences as student-parents of CAPSU Burias.

The results of the study were shared with the eight (8) participants, who confirmed the findings as their own original descriptions, to verify the statements and validate the information.

(12) **Results and Discussions** (This part contains presentation of results (data) with reference to the table and figure, to be followed by discussion, with support of reviewed literature. Sequence shall be based on the objectives of the study. Tables are formatted without the vertical lines. Horizontal lines are set at the top and bottom portions as well as below table headings and above major subdivisions. Justify paragraphs with main headings in caps.)

The ultimate goal of this qualitative study was to explore the stress, motivation and coping Mechanism of Student-Parents of CAPSU Burias . This section presents the results that were obtained after interviewd with the participants.

The emerging theme from the students in the in-depth interviews include: (1) The Stress Encountered as Student- Motherss, (2) Students' motivation in pursuing their studies, and (3) The Students' Coping Mechanism to the Challenges they Encountered.

1. The Stress Encountered as Student - Parents

There were three subthemes that emerged: 1) Financially Burdened, 2) Struggle, and 3) Anxiety, depression

1.1 Financially Burdened

Based on the responses of the participants, they encountered financial problem. They experienced stress with the reimplementation of face to face classes. As reported by some of the participants, they were stress in terms of financial incapacity to sustain the needs of the baby and support their studies. In addition, they cannot focused on their studies since they were financially unstable.

These findings have been highlighted in the study of Gerard, E. (2006), which found out the effects of financial hardship on student parents, who remain a significant although largely unrecognized proportion of the student population.

Moreover, according to the study of Moreau (2016), which states that the main challenges student parents face, according to their views, relate to time, finances, and possible health and emotional issues.

In the course of the interview, the participants were able to thin k aloud and give voices to some of their thoughts about the upcoming face toface classes, how will I manage my time for my baby and my studies? how will I be able to submit all the school requiremts or outputs? And Will I ever get the chance to finish this semester?

The responses form the interview coincides with the articles of Scharp, et al, (2020), which nevertheless, this ongoing process might be met with struggles, uncertainties and opportunities.

1.2 Struggle

Despite their concern and queries, the participants were able to experience struggle in life since they have a baby to attend to, with the gossip about their situation being student-mothers, and difficult to manage their time as student and mother at the same time. Furthermore, difficulty answering various outputs.

	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 5 of 8

1.3 Sleep Deprivation

During the interview, the participants were able to share their experience during face to face classes. They narrated that they got anxiety and depression since they cannot sleep and worried that they cannot finish their studies.

The participants reported that most of the time the participants cried because they donot know what to do withtheir situation.

The result of the study agrees with the findings of (Marandet & Wainwright, 2010) which shows that student parents have shown high levels of sleep deprivation

Furthermore, in the study of Gerrard & Robert (2006) shows high occurrence of depression.

2. Students' Motivation in Pursuing their Studies

There were one subthemes emerged: Inspiration

2.1 Inspiration

Based on the responses, the participants expresses their deep motivation in pursuing their studies for the future of their babies. In addition, the teacherswere approachable and fathom their situation that motivates to continue their studies.

This conform with the article of Brooks (2012), which under this account the student -parents are better students, they are committed and motivated to finish and are successful because their success will benefit their children. Children are often a driving force behind their decision to enter or remain in higher education.

In the same article, Moreau & Kerner (2015) pointed out that their time away from their children will allow them to provide their children with greater knowledge, more financial resources and more quality time in the future.

Furthermore, the parents in laws were very supportive in taking care of my baby while I'm studying.

It was found out in Van Rhijn and Lero (2014) found in their study with 398 student parents that their own beliefs in their ability to function adequately (self-efficacy) in their studies and parental roles predicted their perceived ability to meet the demands of their multiple roles and satisfaction with life. Interestingly, according to this study, family satisfaction fully mediates the relationship between studies – family balance and life satisfaction.

3. The students' Coping Mechanism to the Challenges they Encountered

There were Two subthemesthat emerged: 1) Divine providence, and 2) Positive Outlook

3.1 Divine Providence

Despite their struggles, the participants were able to point out various ways of coping in this time of great adjustment. The situation had also strengthened their relationship with the Supreme Being. They pray to God for guidance despite of early marriage, and surrender everything and believe that God has good purpose forthem.

3.2 Positive Outlook

Having a positive outlook in life allowed the participants to overcome uncertainties especially with the face to face classes. Looking at the brighter side of things have helped them adjust with the pressure and distress.The participants manage their time while taking care of the baby as well as studying their lessons. They have exhausted but inspire doing life for the future of the baby.

The findings of the study coincides with the result of Estes (2011) which based on student

			Effective Date	
			Page	Page 6 of 8

parents' own accounts, some student parents merge their identities as student and parent by explaining how their education makes them better parents; education is seen as beneficial to their children and their children as advantageous to their education.

(13) Conclusions and Recommendations (This part shall be written in narrative form and arranged based on the objectives and findings. Conclusions are general statements answering the objectives. Recommendations are based on the conclusions. They may be split or combined based on their length, which means, conclusions and recommendations may be split under separate headings if they are long. Justify paragraphs with main headings in caps.)

CONCLUSIONS

The study concludes that CAPSU Burias student-mothers are greatly affected and stressed with the implementation of face to face classes most especially in the learning process. There are various factors that hamper them in acquiring quality education however they were optimistic that they will overcome their struggles to enable them to finish their studies for the future of their baby. Despite these tough circumstances, student-parents remain hopeful and remain resilient amidst uncertainty with Divine guidance.

RECOMMENDATIONS

- The university perhaps organize a policy to alleviate not only their physical and mental but their emotional health as well.
- The university may emphasize the practice empathy and learn respect an individual's way of coping.
- The administration may show support by providing policy needed to facilitate the learning process.
- The universities should establish strategies aimed to improve retention of student mothers in higher education institutions

(14) Output (Indicate the specific products, processes or services which the project has produced; quantify when possible.)

(15) Technology Transfer Activity Conducted (Indicate the specific products, activity design, processes or services transferred as extension activities)

(16) Economic Analysis (This should present the direct cost of project implementation, expenses in the production of technology, revenues generated from technology produced, return on investment (ROI) and payback period.
