(8) Rationale

Universities are key players in education and responsible for the integral formation of professionally competent, service-oriented, principled, and productive citizens. Quality services are reflected, particularly those that are accessible.

Parida and Wincent (2019) posit that current trends and future opportunities necessitate people to live in a highly competitive environment and delivering high quality service is the key for a sustainable competitive advantage.

The recent pandemic rapidly increased the demand for teleworking as an alternative mode of rendering service even in government agencies. The positive effect of teleworking in the organizational level cannot be denied, however, coping with the negative impact of work-family conflict resulting from increased technology use is crucial in ensuring that employees' productivity and work-life synergy is maintained.

(9-A) Project Description (Discuss the project strategy and plan of action of the project. It should also describe the technical procedures and other works needed to carry out the project objectives. The relationship of the project inputs and activities should be explained clearly in this section. Projects similar/related to the proposed project should be mentioned.)

(10) Objectives/Statement of the Problem (for Social Sciences) (Statement of the specific purpose to address the problem areas of the project.)

This study will investigate on the productivity and work-life synergy of Capiz State University personnel using teleworking as an alternative mode of rendering government service. Specifically, this research seeks answers to questions:

1. What is the level of productivity of Capiz State University personnel as a whole and in terms of work resources and individual resources?
2. What is the level of work-life synergy of CapSU personnel as a whole and in terms of time management, stress management, technology management, leisure time management, and personal finance?
3. Is there a significant difference in the level of productivity of CapSU personnel when respondents are grouped according to their profile?
4. Is there a significant difference in the level of work-life synergy of CapSU personnel when respondents are grouped according to their profile?
5. Is there a significant relationship between the work-life synergy and productivity of CapSU personnel using teleworking as an alternative method of rendering government service?

(11) Review of Literature/Prior Art Search (Related researchers/activities that have been conducted. State-of –the-art of current technology / information from which the project proposal will take-off).

Thriveni et al. (2012) studied the impact of demographic variables on work-life balance. The result revealed that there is a significant relationship between all demographic variables - age, experience, marital status, income, type of family, number of dependents and perception of work-life balance of employees. This shows that there is a significant relationship between demographic variables and work life balance.

Padma et al. (2013) highlighted the role of family support in balancing personal and work life and found that the support from family members played a significant role in balancing personal and professional

	RESEARCH PROPOSAL	Page	Page 3 of 7

lives. Employees who have adult children can easily balance than those with younger age kids. Similarly, employees who need to take care of elder parents/in-laws health responsibility have lesser work life balance than their counterparts. The study concluded that lower balance may lead to higher absenteeism, lower job satisfaction, and sometimes may turn to higher employee attrition. Organizations with cooperative work culture may help them to bring a suitable balance in their professional and personal life.

Varatharaj and Vasantha (2012) found that work life balance entails attaining equilibrium between professional work and other activities, so that it reduces friction between official and domestic life. Researchers discovered that the majority of respondents felt at ease in their workplace, despite minor personal and workplace irritants. Work-life balance improves efficiency and, as a result, an employee's production. It improves contentment in both professional and personal lives.

Madhusudhan and Nagaraju (2013) have identified the factors responsible for work life balance and extracted that dependents, time flexibility, role clarity, co-worker support, family culture, working hours and head support are responsible for work life balance. Management has to concentrate on time flexibility, role clarity, co-worker support, working hours, and head support for managing work life balance.

According to Fatima and Shahibzada (2012) factors affecting work life balance are partner support, colleague support, and job resources are positively associated with the work life balance, whereas, unfair criticism at job is negatively associated with work life balance. The study reveals that with reference to partner support, male employees are more satisfied with work life balance as compared to females. It is found that female employees felt more work life strain due to child care responsibilities, and it is further noticed that elder dependency is doubling the burden of women than men.

(12) Scientific Basis/Theoretical Framework (Include concepts, theories and variables that indicate relevant relationships to be tested).

This research will be anchored on the Boundary Theory of Nippert-Eng (1996) who proposes that individuals manage the boundaries between work and personal life through processes of segmenting and/or integrating the domains. Boundary theory focuses on the ways that people create, maintain, or change boundaries in an effort to simplify and classify the world around them (Ashforth et al. 2000, Zerubavel 1991). It is based on a general cognitive theory of social classification that focuses on outcomes such as the meanings people assign to work and to home and the ease of transitions between the two. Boundaries can range from thick (associated with keeping work and family separate) to thin (associated with blending work and family) (Allen, Cho, and Meier, 2014).

The study will likewise be anchored on the resource drain theory when considering productivity of employees. This theory states that the individual's resources (e.g. time, energy or attention) are finite, the more they are spent in one domain (e.g. work), the less they can be used in another domain (e.g. family) (Frone, 2003, Morris and Madsen, 2007).

(13) Methodology (Details such as; a) variables to be measured and evaluated; b) treatments to be used and their layout; c) experimental procedures and design; d) statistical analysis; e) evaluation method and observations to be made, strategies for implementation.)

The independent variable will be the profile of the respondents, which includes the age, gender, civil status, highest educational attainment, estimated monthly family income, campus, employment status, nature of work, designation and length of service. The dependent variables will be the level of productivity (such as assurance, reliability, responsiveness, empathy, and tangibles) and Level of Work-life Synergy (time management, stress management, technology management, leisure time management, and personal finance).

This research will use the descriptive-correlational method. According to McCombes (2019), descriptive research aims to accurately and systematically describe a population, situation or phenomenon. It can answer what, where, when and how questions. A descriptive research design can

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01
			Revision No.	00
	Document Title:	RESEARCH PROPOSAL	Effective Date	November 30, 2019
			Page	Page 4 of 7

use a wide variety of research methods to investigate one or more variables. Descriptive research is an appropriate choice when the research aim is to identify characteristics, frequencies, trends, and categories.

Correlational research, according to Bhandari (2021), investigates relationships between variables without the researcher controlling or manipulating any of them. A correlation reflects the strength and/or direction of the relationship between two (or more) variables. The direction of a correlation can be either positive or negative. Correlational research is ideal for gathering data quickly from natural settings. That helps the researcher generalize the findings to real-life situations in an externally valid way.

The descriptive method fits to describe the profile of the respondents, the level of productivity, and the level of work-life synergy. Correlational method will be used to establish significant relationships between the dependent variables of the study.

Three groups of respondents will be utilized in the study: the personnel of CapSU regardless of employment status will be randomly selected and the number will be determined using Slovin's formula to answer the survey questionnaire; the dean/HR head one from each campus for the FGD and one or two spouses of the employees for the interview.

A researcher-made survey questionnaire consisting of three parts will be utilized. Part I will be on the profile of the respondents. Part II will include statements on the level of productivity. Part III will determine the level of work-life synergy. Ten (10) items will be formulated for every indicator and responses. Likert 5-point scale will be used. Cronbach Alpha will be employed to compute the reliability coefficient that will be pretested to thirty (30) personnel not included in the actual study.

The researchers will write a letter to the University President to ask permission to conduct the study and gather data.

The researchers will identify the respondents through drawing of lots.

The researchers will electronically administer the questionnaire to the identified respondents with the help of the campus administrator/HR personnel. Likewise, a focus group discussion (FGD) will be conducted to explore on an in-depth perspective on the participants' productivity and work-life synergy. One representative from each campus will be invited to participate in the discussion. These will be the deans/HR head to explore on the productivity of employees. On the other hand, interviews will also be conducted with the respondents' spouses to gain insights on the work-life synergy of the employees of CapSU.

Data gathered from the survey questionnaire will be processed using the Statistical Package for Social Science Software (SPSS), scored and given corresponding verbal interpretations while results from the FGD and interview will be translated and presented as input to the analysis of the results.

Frequency and percentage will be the descriptive statistical tools that will be utilized to determine the profile of the respondents. Mean will be used to analyze the level of productivity and level of work-life synergy. t-test and ANOVA will be used to determine the significant differences in the level of productivity and level of work-life synergy when respondents are grouped according to profile while Pearson r will determine if work-life synergy is significantly associated with productivity when teleworking practiced in government service.

(14) Major Activities/Work plan (Enumerate in chronological order the task to be undertaken. Use gantt chart.

WORK PLAN (PROJECT MONITORING AND EVALUATION CHART)

Research Objectives	2022												2023	
	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar			Nov	Dec
1. Gathering and reading materials connected to the study of interest														
2. Writing of Proposal														
3. Field Work/Data Gathering														
4. Analysis of data gathered														
5. Writing the analysis of data														
6. Colloquium Defense														

(15) Expected Output (Indicate the specific products, processes or services which the project is expected to produce; quantify when possible)

- Encourage productivity among CapSU faculty and personnel.
- Work-life synergy among CapSU faculty and personnel in terms of time management, stress management, technology management, leisure time management, and personal finance.

(15) Technology Transfer Activity Design (Indicate the specific products, activity design, processes or services to be transferred as extension activities)

(16) Target Beneficiaries (Who the clienteles are and what are the expected outcome/effects of the use of the projects output)

- CapSU faculty, personnel and administration
