(9) Rationale Grit plays a significant role in the field of education today as indicated by research. It involves working persistently towards a challenging objective, sustaining effort and keeping a persistent interest despite failures, setbacks, and obstacles in the course of progress. Scholars consider grit as a manifestation of character strength drawn upon to attain one's ability (Soutter & Seider, 2013). Usually gritty individuals use stamina to keep on track and achieve their goals despite the challenges on hand, contrary to individuals who have low grit that gets easily bored or disappointed and give up effort or choose alternative actions (Duckworth et al., 2007). Grit is therefore considered an important factor of success and excellence in work regardless of challenges (Duckworth & Yeager, 2015). High grit has shown to anticipate success in workplace resulting to quality work in many aspects. People with grit know what they want and what they like to pursue in life or in work. Once they discern their goals, they work hard to achieve them with quality regardless of challenges. On the other hand, work quality refers to the value of work rendered by an individual, team or organization. This covers the quality of task completion, interactions, and deliverables. Quality of work therefore bridges the gap between job quality. It constitutes the activity of work itself and the conditions under which it takes place. However, as the education sector moves in the new normal, teachers are confronted with so much responsibilities and multiple stress concerning their health and pressure in work resulting to low performance and output in school which will test their grit and quality output. Thus, this study is conceptualized to use the concept of grit and work quality of teachers to ensure the quality of performance in terms of instruction, research, and extension as well as to aid the pursuit of success in the long run.		
(10) Objectives/Statement of the Problem This study will explore the following questions: 1. What is the level of grit of teachers in general and in terms of pliability and quality? 2. What is the level of work quality of teachers in general and in terms of instruction, research, extension, and production? 3. Is there a significant difference on the level of grit of teachers when grouped according selected profile such as civil status, highest educational attainment, length of service, number of loads, and number of designations? 4. Is there a significant difference on the level of work quality of teachers when grouped according selected profile such as civil status, highest educational attainment, length of service, number of loads, and number of designations? 5. Is there a significant relationship between the level of grit and the level of work quality of teachers?		
(11) Review of Literature/Prior Art Search Grit is about sustained, consistent effort toward a goal even when individuals struggle, falter, or temporarily fail. Grit varies from person to person and is influenced by our culture (Miller, 2021). Every individual has a different level of grit, teachers as well. It means that their strengths and weaknesses

		Page	Page 3 of 5

may also vary from one another. A teacher may concentrate on his strengths and use this to his advantage. A teacher must not be stuck with his weaknesses instead he must overcome them through facing the challenges (failures are not constant), constant practice, and by asking the help of superiors or colleagues. Teachers' main objective is to make their learners learn from them. They teach learners to learn new things, acquire knowledge, and shape their behaviors as well. On the other hand, Teachers have a lot of responsibilities, aside from teaching learners he also bombarded sometimes with papers works, a toxic environment, and responsibilities at home. Teachers must be courageous and resilient enough to face these various tasks and to balance their lives. Such tough experiences of the teachers will help them to be gritty.

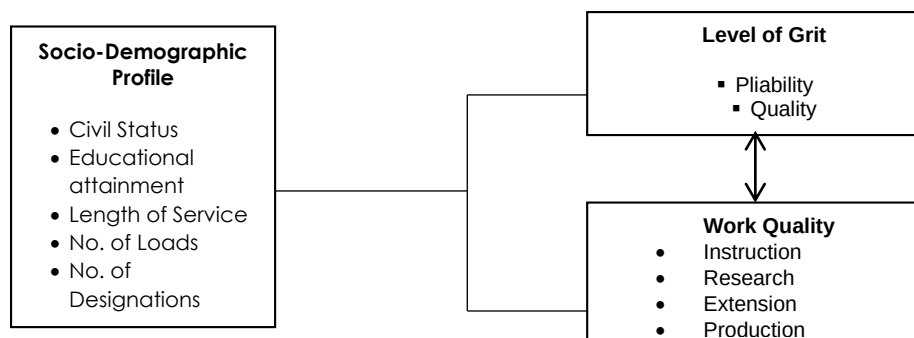

A number of studies have also focused on the importance of grit for employment outcomes. The associations between grit and work performance as well as various personalities construct among 1134 working adults in Japan. Grit was a significant predictor of both better work and academic performance (Suzuki, Tamesue, Asahi, and Ishikawa, 2015). The extent to which redundancy existed in work ethics and grit in a sample of 322 employed students at a large public university (Meriac, Slifka, and LaBat, 2015). Work ethics and grit were highly correlated and both were associated with conscientiousness. Specifically, work ethics explained a significant portion of variance in job satisfaction and turnover intentions above and beyond grit. Thus, the authors concluded that work ethics and grit were distinct (Vazsonyi et al., 2019). Like any other job, teaching is a demanding job. It needs a lot of hard work and dedication in order for the learners to learn. The level of grit of teachers can contribute to the improvement of the performance of the learners. An established environment, supportive school heads, teachers with team spirit, and supportive stakeholders are also motivating factors to increase the overall performance of the school, which means teachers can utilize their full potential in teaching and honing learners' abilities and skills. Having productive learner means successful teaching outcomes.

(12) Scientific Basis/Theoretical Framework

This study was anchored on "Grit Theory" by Duckworth (2007), which views that success is not determined by the capacity to learn quickly and easily, good luck, IQ scores and physical health. Instead, high achievers are people who have passion, perseverance with learning, and willingness to overcome failure. Being aware that you are the person who controls your own motivation and outcomes is in fact what drives success.

The theory was deemed appropriate in the present study because Duckworth's Grit Theory has implications for achieving the teaching and learning goals. It further emphasizes that grit is important for success by investigating factors concerned with learning. It involves a number of attributes, like being self-aware with learning, focusing on motivation, and achieving goals. Individuals must learn that passion and perseverance help to stay motivated and achieve goals. It is important to note that talent is not always necessarily linked to success.

The paradigm of the study is presented in the following figure:

(13) Methodology (Details such as; a) variables to be measured and evaluated; b) treatments to be used and their layout; c) experimental procedures and design; d) statistical analysis; e) evaluation method and observations to be made, strategies for implementation.)

The study will employ a mixed method of research design using quantitative and qualitative data. The respondents will be the teachers of the CAPSU Main Campus who will be chosen through random sampling. A researcher-made questionnaire composed of three parts will be used to gather the needed data. Part I will gather data on socio-demographic profile. Part II will deal on grit focusing on pliability and work quality. Part III will be on work quality in terms of instruction, research, extension, and production. The questionnaire will be subjected to content validity and reliability testing. The researchers will triangulate quantitative data through in-depth interview to validate results.

Frequency count, percentage, mean, ANOVA, and Pearson r will be used in the analysis of data. An interview guide question will be used for the in-depth interview.
