(9A) Abstract

Developing achievement motivation and academic resiliency among learners allows them to become goal-achievers and resilient amidst difficulties. This study was conducted on 44 college student parents to (1) determine their academic performance, achievement motivation, and academic resiliency as a whole and when grouped according to profile; (2) find out the significant differences that existed in their academic performance, achievement motivation, and academic resiliency when grouped according to profile; and (3) determine the significant relationships between their academic performance, achievement motivation, and academic resiliency.

This descriptive, correlational research design, particularly associational, used a complete enumeration in selecting the respondents. Data were analyzed using the Mean, Standard Deviation, Independent Sample Kruskal-Wallis Test, Independent Sample Mann-Whitney U Test, and Spearman's rho. Findings revealed that the student parents had "satisfactory" academic performance, "high" achievement motivation, and "high" academic resiliency. No significant differences were found in the academic performance level when grouped according to age, sex, course, year-level civil status, and number of children. No significant differences were noted in their level of achievement motivation as to age, course, year level, and civil status. However, the result highlighted that female student parents had significantly higher achievement motivation than males, and those with three or more children had significantly higher achievement motivation than those with one to two children.

In light of producing motivated and resilient student-parent learners, the academe may establish initiatives to strengthen their academic resiliency, motivation, and learning performance to succeed.

(9B) Keywords

student parents, academic performance, achievement motivation, and academic resiliency

Introduction

Education is a continuing, lifelong process. It begins with birth and terminates upon death. It does not exempt anyone, regardless of status, color, race, age, or gender. Individuals are poised to remain motivated and resilient if they believe their abilities and knowledge can be enhanced through perseverance, dedication, and effort. This mindset generates a never-ending hunger for knowledge and success. Their commitment to growth and passion exemplifies the lasting worth of education and inspires others to take steps to succeed.

Every year, the number of student parents entering the university is increasing. This primarily comprises student mothers and fathers who have returned to school or have started university late, or those student mothers who have given birth either in high school or during their studies. Pursuing their tertiary education means balancing the dual role of being a student and parent at the same time, which seemed to be a very challenging task.

Several studies demonstrated that student parents benefit from their level of maturity and life experiences by being more focused on what they want to pursue in their future career, having a greater awareness of their likes and dislikes, and being better prepared to make informed decisions about their education. (Holmes, 2005; Murphy & Roopchand, 2003). Simultaneously, student parents face unique challenges due to their circumstances and obligations, such as having less flexibility in continuing their academic studies (often due to class scheduling), family-related roles and commitments, childcare responsibilities, and additional financial commitments (Butlin, 1999; van Rhijn et al., 2011).

This study, which primarily aimed to find out the student parents' achievement motivation, academic resiliency, and performance, is also in line with the foregoing reviews and studies. Okoro (2020) mentioned in his study that achievement motivation played a positive and important effect on the extent to which students are interested in their academics. Motivation is the energy and drive to learn and succeed, and while students face many challenges in their academic pursuits, when goals are set by students, it drives them into full engagement in their studies, which eventually results in good academic

			Page	Page 3 of 9

success. On the other hand, academic resiliency is determined as both an incentive for attaining academic and individualized objectives and a provider of adequate mechanisms to cope with stress and nervousness that happen in the university context (Cassidy, 2016). Radhamani and Kalaivani (2021) found in their studies that academic resilience improves the academic achievement of students. Academically resilient students maintain high levels of academic achievement even in the face of stressful and complicated circumstances that lead to the risk of low grades in schools.

(11) Materials and Methods or Methodology

This descriptive-correlational research, particularly associational, used 44 student parents enrolled at Capiz State University Dumarao Satellite College, First Semester, School Year 2022-2023, who were selected using complete enumeration sampling.

An adopted questionnaire on achievement motivation and academic resiliency was used to gather student responses, while the academic performance was taken from their previous GPA. The collected data were encoded in Microsoft Excel and processed in the SPSS software for analysis.

(12) Results and Discussions

Table 1.0 shows the level of academic performance of student parents as a whole and when grouped according to profile. The overall academic performance of student parents was “Satisfactory”.

As to age, sex, and civil status, the result was “Satisfactory”, while to course BS Criminology had a “Fair”, same with the third-year level. However, student parents who had 3 and above children had “Very Satisfactory” result.

Table 1.0 Mean level of academic performance of student parents as a whole and when grouped according to profile.

Socio-Demographic Profile	Mean	Sd	Interpretation
Entire Group	2.1682	.30606	Satisfactory

level, and civil status, however, significant differences existed as to sex and number of children. 4.

This implies that female student parents had a higher achievement motivation compared to males. Furthermore, there is a significant difference between the achievement motivation and the socio-demographic profile, particularly in the number of children. This shows that those who had two to three children had higher achievement motivation than those who had one or two children

Table 5.0. Significant differences in the level of achievement motivation of student parents when grouped according to profile.

Table 7.0 presents the significant relationship between the level of academic performance, achievement motivation, and academic resiliency of student parents. The result showed that there was no significant relationship existed between the level of academic performance, achievement motivation, and academic resiliency, however, achievement motivation was significantly related to student parents' academic resiliency.

This agrees with the study of Radhamani and Kalaivani (2021), which found academic resilience improves the academic achievement of students. Academically resilient students maintain high levels of academic achievement even when confronted with stressful and challenging conditions that risk them receiving poor grades in school. Similarly, Herrman et al. (2011) claimed that resilient learners can overcome stress and retain high mental strength regardless of difficulties.

Table 7.0 Significant relationship between the level of academic performance, achievement motivation, and academic resiliency of student parents

*. Correlation is significant at the 0.05 level (2-tailed).

(13) Conclusions

- The academic performance of student parents was "Satisfactory" which means they are performing well in their studies.

	Document Title:	COMPLETED RESEARCH	Revision No.	00
			Effective Date	
			Page	Page 8 of 9

2. Both their achievement motivation and academic resiliency of student–parents were “High”. This shows that they are highly motivated toward their studies and more driven to accomplish their academic goals and tasks, and they can withstand or cope with the difficulties they encounter in their studies.
3. It was found that there were no significant differences in the level of academic performance among student parents.
4. There was a significant difference between achievement motivation and socio-demographic profile, particularly in sex. This implies that female student parents had a higher achievement motivation compared to males. Furthermore, there is a significant difference between the achievement motivation and the socio-demographic profile, particularly in the number of children. This implies that those who had two to three children had higher achievement motivation than those who had one or two children.
5. It was found that there were no significant differences in the level of academic resiliency among student-parents. There is no significant relationship between the levels of academic performance, and achievement motivation. However, there is a significant relationship between achievement motivation and academic resiliency.

Generally, the results of the study imply that the higher the achievement motivation of the student-parents, the higher their academic resiliency. In addition, the student–parents had a strong desire to learn and finish their studies despite the challenges they face as a parent and as a student.

Recommendations

1. The administration may develop initiatives that will benefit the student parents, particularly in improving their academic performance.
2. The teachers may provide interventions to cater to the academic needs of student parents especially those who are struggling.
3. The student parents may seek help from teachers regarding their major concerns about their studies and find ways to cope with other students.
4. Further studies related to this research may be conducted.

(14) Output

Baseline information for the study of the achievement motivation, academic resiliency, and performance of college student parents.

(15) Technology Transfer Activity Conducted (Indicate the specific products, activity design, processes, or services transferred as extension activities)

(16) Economic Analysis (This should present the direct cost of project implementation, expenses in the production of technology, revenues generated from technology produced, return on investment (ROI) and payback period.

(17) Acknowledgments (Include only important persons and institutions with involvement in funding and conduct of the research. Justify paragraphs with main headings in caps.)
