(9) Rationale

The COVID-19 pandemic has made changes to many facets of life from working conditions to freedom of movement. Education has been one of the sectors disrupted by the crisis with educational provision going into different platforms of learning. In higher education, on one hand, this has highlighted certain advantages to on-line studying including lower living costs for students who would otherwise study away from their family home. On the other hand, it has underlined inequalities between students particularly in relation to differences in terms of digital skills and home environment resources.

Home education has brought a lot of shocks not only to students but also to their parents' productivity. As teaching has moved from physical to virtual classrooms at "untested and unprecedented" level, parents have to spend more time monitoring their children and motivating them to continue education (Burgess and Sievertsen, 2020). These issues had been acknowledged by CHED since the surge of Covid 19. The most important observation recognized by the Commission on Higher Education were "there are disadvantaged learners and families living in challenging and vulnerable conditions. These learners may lack access to the Internet service and necessary devices, or do not possess the skills necessary to use online opportunities. The CAPSU in particular addressed this issue by creating different platforms to address the needs of the students. It utilizes, online, blended and modular mode of delivering instruction.

The isolation measures created by the government had learners and educators to confine at their homes; a disturbing social life and learning at isolation has made it stressful for students and educators. The mere essence where group learning and group classroom activities are being missed by both educators and students can be led to academic stress. Low physical activity and spending all time at home creates negative impact on the well being of the students hence affecting their academic activities, which all of us are trying to overcome using a lot of other activities to cope with this condition. As students experience a high level of stress arising from unprecedented academic pressure, most of them experience low self-esteem and a poor concentration that has its impact on their academic performance (Bedewy and Gabriel, 2015).

Emotional intelligence on the other hand, is the understanding emotions of once self, helping oneself to direct the emotional reactions and labeling the experiences of different emotions and helping others to understand and help people to channelize their emotions. Higher emotional intelligence helps to more effectively cope with stress when it has been experienced (Kerasidou & Horn, 2016; Petrides et al., 2016). When confronted with a stress causing event, stress coping strategies are activated. Higher emotional intelligence is related to the selection of adaptive coping strategies (Sarabia-Cobo et al., 2017).

The disturbed education cause by the sudden lockdown has made it very difficult for educational institutions, educators, students and their families and creating a negative impact on their personal, emotional, social and financial well-being. How the students cope with these stressors should be given attention as future reference in creating policies. Hence, this study.

(9-A) Project Description (This is a descriptive correlational research aimed to understand the academic stress experienced by the students of Capiz State University and their coping strategies using emotional intelligence in relation to their academic performance)

(10) Objectives/Statement of the Problem (for Social Sciences) (Statement of the specific purpose to address the problem areas of the project.)

This study will be conducted to understand and analyze the academic stress as experienced by students and their coping strategies using their emotional intelligence during the current COVID-19 pandemic. Specifically:

1. What is the academic stress experienced by students during the covid 19 pandemic?
2. What coping strategies (using emotional intelligence) used by students to overcome academic stress?
3. Are academic stress and emotional intelligence of students significantly affects their academic performance?

(11) Review of Literature/Prior Art

The pandemic of COVID-19 pandemic is affecting schools, students, teachers, and parents. The COVID-19 crisis increases social inequality in schools. Students from more advantaged parents attend schools with better digital infrastructure and teachers might have higher levels of digital technology skills. Some schools can be well equipped in digital technology and educational resources. Disadvantaged students are attending schools with lower ICT infrastructure and educational resources (Di Pietro et al., 2020). Following COVID-19 more advantaged students are attending schools to adopt online learning. Schools in disadvantaged, rural areas lack the appropriate digital infrastructure required to deliver teaching at the remote. Also, there is a significant difference between private and public schools in technology and educational resources. In most countries, private schools are more effective than public schools. Students' have not equal access to digital technology and educational materials. In the (Woday et al., 2020) survey, the study finds during schools closure the level of anxiety, depression disorders, and stress are high among students.

The lockdown due to coronavirus may people are feeling stress, fear, and anxiety, such as a fright of dying, a fear of their relatives dying (Sahu, 2020). This stress may affect the students, mental, and physical health of students. The pandemic may have a serious influence on the careers or may have not to graduate of this years' higher education undergraduate students (Niranjan, 2020). All students may not have good interaction with online learning applications and platforms (Haleem et al., 2020), because some of the students are active and some may take a longer time to familiarize themselves with the system

Stress can have an impact on a student's academic performance which can be both positive and negative depending on its severity. Minimal level of stress can lead to positive outcomes such as motivation and improved task performance while severe stress can result in anxiety, depression, social dysfunction and even suicidal intention. Gender role and academic disciplines are two of many possible stressors for students. There was no significant difference in level of academic stress between students from BBS and students from BASW $t(98) = 1.43$, $p = 0.156$, and there was no significant difference in level of academic stress between male students and female students $t(98) = 1.40$, $p = 0.166$. Role of social, psychological, academic, and cultural factors as stressors are discussed (Sandesh Dhakal, 2013).

Adolescent is a crucial period for developing emotional intelligence behavior. But the matter has received little attention for the public, psychologist, and researchers in the past. Goleman's (1995) first drew attention on the importance of emotional intelligence to researchers. Gintarė Montvilaitė, Dalia Antinienė (2019) stated that there is a statistically significant correlation existed between emotional intelligence and stress coping strategies of medical residents. Positive correlation was determined between emotional intelligence and adaptive stress coping strategies,

			Page	Page 4 of 7

while negative correlation was observed between emotional intelligence and maladaptive stress coping strategies.

Academic performance is the level of learning in a particular area of subject in terms of knowledge, understanding, skill and application usually evaluated by teachers in the form of test scores in their annual examination. Academic stress is the product of a combination of academic related demands that exceed the adaptive resources available to an individual (Wilks, 2008). Kaplan et al., (2005) supported the hypothesis that early adolescent school-related stress both independently and in interaction with high academic expectations negatively affected academic performance. Malik and Balda (2006) explored that the academic achievement or performance was to be negatively and significantly correlated with all types of stress except existential stress. Sohail (2013) conducted a study to determine the relationship of stress and academic performance in first year medical students and the results show that higher level of stress is associated with poor academic performance. Bharti (2013) concluded in his study that higher level of institutional stress is associated with poor academic performance.

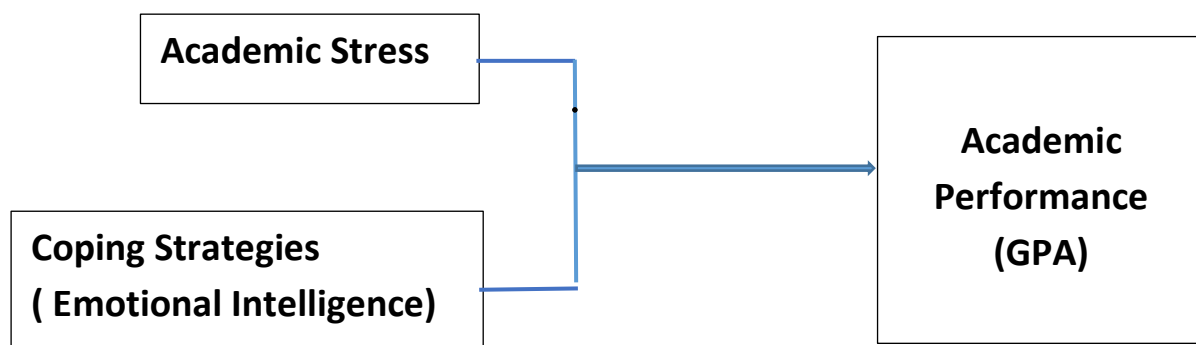

Furthermore, the study of Yamini Chandra (2021) indicated significant differences were observed between the fear of academic failure and online and home environment among male and female students. Many of them have started diverting themselves to various creative activities and taking up courses that are helping them to learn new technical skills. By using emotional intelligence and distancing from boredom and depressive thoughts, students were trying to cope with negative effects arising from the current pandemic situation.

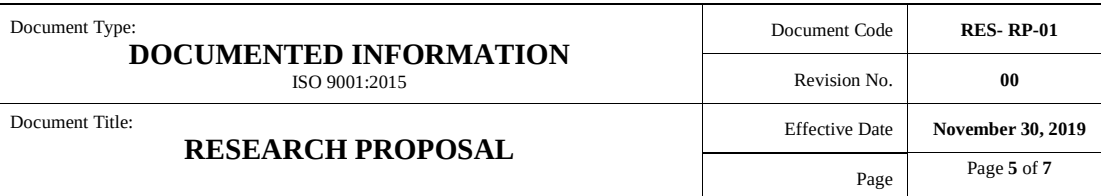

(12) Scientific Basis/Theoretical Framework

Due to COVID-19 pandemic, the government has closed all the educational institutions to control the spread of disease, which is creating a direct impact on students, educators and institutions. The sudden shift from the physical classroom to virtual space is creating a disruption among students. The purpose of this study is to analyze the academic stress experienced by students during current educational platform and their coping strategies using emotional intelligence adopted by them and its effect to their academic performance .

Independent Variable

Dependent Variable

The respondents of the study will be the college students of Capiz state university in the second district of Capiz. Stratified sampling technique will be utilized by the researcher to select the sample. The data will be collected using google form since face to face is limited. The tools to be used for data collection will be a survey questionnaire comprising of 3 part. Part 1 is the demographic profile. Part 2 is the Perceptions of Academic Stress Scale (PAS) (Bedewy and Gabriel, 2015) which is an 18-item, five-point Likert-type scale to measure perceptions on academic stress and its sources in students. The responses ranged from (1 - 5 (1) strongly disagree to (5) strongly agree). Part 3 is an Emotional Intelligence Scale (EIS) is a 32-item, five-point Likert-type scale to measure emotional intelligence among people. The responses ranged from (1 – strongly disagree to 5 - strongly agree). Data collected will be analyzed using SPSS software.

(14) Major Activities/Work plan (Enumerate in chronological order the task to be undertaken. Use gantt chart.

Research Objectives	Year 1						Year 2			
	July	Aug	Sept	Oct	Nov	Dec	Jan	Feb	Mar	Apr
1. Proposal Preparation										
2. Data collection and Analysis of data gathered										
3. Data presentation , discussion, conclusions and recommendation										

	Document Type:	DOCUMENTED INFORMATION ISO 9001:2015	Document Code	RES- RP-01

(15) Expected Output (Indicate the specific products, processes or services which the project is expected to produce; quantify when possible).

(15) Technology Transfer Activity Design (Indicate the specific products, activity design, processes or services to be transferred as extension activities)

(16) Target Beneficiaries (Who the clienteles are and what are the expected outcome/effects of the use of the projects output)

Students and educators

(17) Personnel Requirement

Name	Role (Program,Project, Study Leader)	Field of Specialization

Percent time devoted to the Program/ Project/ Study

Program/Project Leader (in hours):

Program/Project Members (in hours):

(18) Budgetary Requirement

SOURCES OF EXPENSES	Quantity	Amount (PhP)
A. Personnel Services (For studies needed the Research Assistant, informant/s, guide)		
B. Maintenance and Other Operating Expenses (MOOE) (modify and include only whichever is applicable)		
- Transportation allowance		5,000
- Meal allowance during data gathering		5,000
- Professional fees (laboratory analysis and other related fees)		
- Miscellaneous (for incidental expenses)		1000
- Printing		1000
C. CAPITAL OUTLAY		
Total		12,000
