(9) Rationale (State the research problem and significance of the project to the current needs of the country. The proposal should justify resource expenditure. A typical justification would include a brief introduction, a general statement concerning the historical basis for R & D and, thrusts being addressed, utilization of the expected output and the impact information generated will have on science, the target users and the country.)

The Philippines is one of the world's most disaster-prone countries. Hit by an average of 20 typhoons each year, the Philippines is a low middle-income country that is highly vulnerable to various natural hazards such as floods, volcanic eruptions, earthquakes, landslides, and drought (Climate Change Risk in the Philippines: Country Fact Sheet, 2017). The country also ranked the fifth most affected by extreme weather events between 1996 and 2015 with losses amounting to 2.7 billion US Dollars (Global Climate Risk Index, 2017).

The Philippines is prone to climatic conditions such as the inter-tropical convergence zone (ITCZ), thunderstorms, monsoons, and typhoons. Annually, an average of 20 tropical cyclones goes through the region, nine of which directly hit the country. Related climate risks expose the Philippines to super-typhoons, El Niño, projected temperature rises and intense rainfalls, and floods (DENR 2010).

The climate change scenario for 2050 prepared by the Philippine Atmospheric, Geophysical and Astronomical Services Administration (PAGASA) shows that the country's average annual mean temperature is projected to increase by between 1.7 °C to 3.0 °C by 2050. The average volume of rainfall in the Philippines reached 2.87 thousand millimeters in 2021, indicating an increase from the previous year's average. Many coastal and small island (CSI) communities in the Philippines are thus extremely vulnerable to the impacts of climate change and hydro-meteorological hazards. The province of Capiz typically receives about 127.83 millimeters (5.03 inches) of precipitation and has 236.82 rainy days (64.88% of the time) annually (Weather and Climate Ph.). By too much precipitation, the province of Capiz has declared under the state of Calamity because of flooding for several times (Panay News, 2022). One of the Municipalities that was affected is Mambusao. According to Weather and Climate Ph, Mambusao typically receives about 129.17 millimeters (5.09 inches) of precipitation and has 239.31 rainy days (65.56% of the time) annually. In an interview to Esperidion Pelaes of the Provincial Disaster Risk Reduction Management Office (PDRMO) last 2018 he said that Sigma and Mambusao are catch basins of water from the Municipality of Jamindan and Tapaz hence they are prone to flooding when heavy rain occurs. Thus, based on the MGB Flood Susceptibility map (2015) out of 26 barangays in Municipality of Mambusao; 24 of them are prone to flooding.

One resource that can be mobilized to help them to reduce disaster risks is the local and indigenous knowledge (LiNK) in these communities. The local and indigenous knowledge gain more credence across all levels of advocacy and engagement to harness and build on local capacities. In fact, last 2010 the enactment of the Philippine Disaster Risk Reduction and Management Act or RA 10121 institutionalized and required the active engagement and participation of vulnerable sectors and marginalized communities, also highlighting the need to integrate local and indigenous knowledge into local DRRM planning processes. The landmark law institutionalized better sharing and mainstreaming of best practices at the local and *barangay* levels by ensuring that disaster risk reduction and climate change measures are “gender responsive, sensitive to indigenous knowledge systems, and respectful of human rights (Philippine DRRM Act of 2010).

LiNK, based on UNESCO's programme on Local and Indigenous Knowledge Systems (LINKS), is defined as the “understandings, skills, and philosophies developed by societies with long histories of interaction with their natural surroundings. For rural and indigenous peoples, such knowledge informs decision-making about fundamental aspects of day-to-day life (UNESCO, undated)”. Communities foster and develop this body of wisdom and knowledge by observing and monitoring weather patterns, behavior of insects and animals, notable changes in biodiversity, and activities of celestial bodies.

LiNK has been the fundamental basis of communities for monitoring, assessing, and addressing the disaster risks to which they are exposed, helping them develop indigenous ways to prevent or mitigate the impacts of hazards not only to their households but also to their livelihoods (Amador and Naldoza, 2023).

However, studies acknowledge that most of these indigenous strategies are unsustainable amid the increasing occurrence of disasters. This is because they only help in the short-term and often fail in the face of serious events (Mavhura et al., 2013).

Thus, to mobilize these resources, the present study will make an inventory of the Local and Indigenous Knowledge of flood prone Barangays of Mambusao, Capiz validate them to establish their scientific basis, and promote and integrate them into education, policies, programs and projects for disaster risk reduction (DRR), hence this study.

(9-A) Project Description (Discuss the project strategy and plan of action of the project. It should also describe the technical procedures and other works needed to carry out the project objectives. The relationship of the project inputs and activities should be explained clearly in this section. Projects similar/related to the proposed project should be mentioned.

(10) Objectives/Statement of the Problem (for Social Sciences) (Statement of the specific purpose to address the problem areas of the project.)

This study primarily aims to integrate the local and indigenous knowledge (LInK) of residents of two barangays in Mambusao, Capiz in local disaster risk reduction planning and extension activity. More specifically, it has the following objectives:

- 1) To identify and document existing local and indigenous Knowledge on hydro-meteorological hazard of community members from Barangays Tomalalud and Tugas, Mambusao, Capiz.
- 2) To validate the local and Indigenous Knowledge on hydro-meteorological hazard in flood prone Barangays of Mambusao, Capiz using LIVE Scientific Knowledge.
- 3) To develop Information, Education, and Communication Materials for Disaster Risk Reduction.

(11) Review of Literature/Prior Art Search (Related researchers/activities that have been conducted. State-of –the-art of current technology / information from which the project proposal will take-off).

In recent years, the call for integrated, community-based, and sustainable strategies toward addressing the impacts of disasters have gained more ground not only at the national but also at the regional and global levels. Mercer, J. Kelman, I., Taranis, L. and Suchet-Pearson, S. (2010), stated the significance of “increased utilization of knowledge of the indigenous people” in mitigating hazards and reducing disasters in local communities. In the same light, Smit and Wandel (2006), noted that some developing countries are employing “bottom-up approaches” and investing in “indigenous knowledge in developing DRR initiatives applicable to their situations.”

Walshe and Nunn (2012) and Lauer (2012) describe how indigenous knowledge about tsunami risks and responses, in combination with scientific and other knowledge, played an important role in helping villagers survive the 1999 tsunami in Vanuatu and in the Solomon Islands in 2007.

The 2004 Indian Ocean tsunami has been credited with sparking interest in integrating indigenous knowledge with science for disaster risk reduction (Mallapaty, 2012) and many such efforts have been undertaken worldwide. In Vanuatu, participatory volcanic hazard awareness and education that incorporates traditional knowledge with volcanology has been developed for disaster-preparedness planning (Cronin et. al., 2004) and Cronin, (2007).

With respect to flooding, local communities have over the years applied indigenous knowledge in flood response and management (Ringo et al., 2016; Danladi et al., 2020). It is applied in predicting the occurrence of floods, responding to and recovering from floods. Across Africa, communities are known to have a good understanding of weather patterns and employ this knowledge in predicting impending flooding. For instance, the study of clouds and trees and the behavior of some animal species help in predicting floods (Munsaka and Dube, 2018). Predictions are also made based on the behavior of local flora (Hooli, 2016). Local elders serve as repertoires of meteorological knowledge and use this knowledge acquired over the years in making flood predictions (Hooli, 2016; Yoshizumi et al., 2012). Other widely deployed indigenous knowledge in flood risk management include monitoring of the degree of rainfall in upper catchments, lunar observations, behavior of aquatic animals and birds, observing the color of water bodies, identifying cloud position, analyzing the magnitude of wind and thunderstorms, monitoring sounds from rivers and torrents, studying the mobilization of ants, etc (Devkota et al., 2013; Fabiyi and Oloukoi, 2013; Mapedza et al., 2022; Mahoo et al., 2015). Ecological indicators like scarcity of certain vegetation also serve as indicators of impending floods (Fabiyi and Oloukoi, 2013). Predictions or forecasts based on indigenous knowledge have also been proven to be fairly accurate (Mahoo et al., 2015).

Indigenous communities are also known to deploy available local materials and resources to put up structural barriers as flood interventions (Munsaka and Dube, 2018; Mavhura et al., 2013). These include levees, sandbags, digging of channels for waters, building embankments with local materials like mud, construction of earth drains (Kometa, 2019; Hooli, 2016). Some agrarian communities also adapt and cope with flooding by farming early maturing varieties of crops, early harvesting of crops and relocating to higher grounds (Obi et al., 2021; Echendu, 2022b)

(13) Methodology (Details such as; a) variables to be measured and evaluated; b) treatments to be used and their layout; c) experimental procedures and design; d) statistical analysis; e) evaluation method and observations to be made, strategies for implementation.)

This study primarily aims to integrate the local and indigenous knowledge (LInK) of residents of flood prone barangays in Mambusao, Capiz as basis for extension activity. Action research will be employ in this study. Action research is a qualitative research design that focuses on solving problems in social systems, such as schools and other organizations. The emphasis is on solving the presenting problem by generating knowledge and taking action within the social system in which the problem is located. The goal is to generate shared knowledge of how to address the problem by bridging the theory-practice gap (Bourner & Brook, 2019).

Lewin (1946), stated that action research can “transform...unrelated individuals, frequently opposed in their outlook and their interests, into cooperative teams, not on the basis of sweetness but on the basis of readiness to face difficulties realistically, to apply honest fact-finding, and to work together to overcome them”.

The study participants will be identify using a purposive sampling method based on the following criteria: (a) born and raised in the said barangay for more than 50 years; (b) willing to participate in the study. The researcher will ask for their permission before they will be consider as participants.

The study will employ focus group discussions (FGDs) using a semi-structured questionnaire in flood prone Barangays to determine the local and indigenous knowledge (LInK) then documenting, validating, and integrating the latter with scientific data at the local level through a process termed “Local knowledge and practices Inventory, Validation, and Establishing Scientific Knowledge (LIVE Scientific Knowledge)” Focused group discussions (FGDs) is a qualitative research tool where a moderator leads a targeted conversation with a small group to explore their perceptions and opinions on a specific subject. This method is useful for understanding group norms and behaviors and informing survey design. FGDs leverage the group’s interaction to elicit rich, detailed insights.

LIVE Scientific Knowledge involves five (5) phases namely: Preparation, Data Gathering, Analysis and Validation, Science Integration and Popularization and Utilization.

Preparation Phase

This phase includes the preparation on ocular visit and inception meeting with the Local Government Unit of Mambusao, Capiz as the main partner and beneficiary of this research. Data-gathering tools will be develop putting into consideration the local culture thus employing the local dialect in the tools and in the actual conduct of the research.

Data Gathering Phase

Inception meeting with the Barangay Captain of flood prone Barangays will start after this research proposal will be approve. In the said meeting, target interviewees for the KII and participants for the FGD will be identify. The objectives of the fieldwork will be clearly discuss. Primarily, the data-gathering process aims at coming up with the inventory of the local and indigenous knowledge of community members of Barangays Tumalalud and Tugas which are directly related to DRR.

LinK Analysis and Validation Phase

KII and FGD results will be categorized based on the respondents’ observation of cosmic bodies (sun, moon, and stars), animal behavior and their observation of the environment such as wind, plants, clouds, etc. These are all considered as directly related to hydro-meteorological phenomenon. The researcher will conduct interview to validate the LInK with the different experts and scientist. The participants of the KII and FGD, together with the barangay officials of will be join to be involve in the said activity.

The Scientific Integration Phase

Local and indigenous knowledge with a scientific explanation (LINK Category I) is combined with empirical data from the field. This can be done in the community with close cooperation with scientists.

LINK Popularization and Utilization Phase

This is the final phase of this study wherein those local and indigenous knowledge on hydro-meteorological hazard with scientific explanation will be utilize in making information, education and communications (IEC) materials which will be used by communities themselves, by scientists for further research, and by practitioners and government entities for disaster risk reduction and management plans and crafting contingency plan for hydro-meteorological hazard.

(14) Major Activities/Work plan (Enumerate in chronological order the task to be undertaken. Use gantt chart.

Research Objectives	Year 1						Year 2					
	July	Aug	Sept	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun
1. Planning												
2. Data Gathering												
3. Analysis and Validation of data gathered												
4. Finalization and printing of research book												

(15) Expected Output (Indicate the specific products, processes or services which the project is expected to produce; quantify when possible)

The output of this study is an extension activity to develop IEC materials to be use by communities themselves, by scientists for further research, and by practitioners and government entities for disaster risk reduction and management plans and crafting contingency plan for hydro-meteorological hazard.

(16) Technology Transfer Activity Design (Indicate the specific products, activity design, processes or services to be transferred as extension activities)

(17) Target Beneficiaries (Who the clientele are and what are the expected outcome/effects of the use of the projectsoutput)

The beneficiaries of the result of this study is the community residence of flood prone Barangays as basis in crafting their BDRRM plan where LInK with scientific explanation will be integrated.
